# Introduction to WAVE

- What are the problems WAVE is addressing?
- What are the WAVE solutions?
- WAVE participating companies
- WAVE work structure

**Fragmentation  
is  
Expensive**

# Supporting a fragmented OTT world

- Fragmentation impacts content providers and device makers:
  - Multiple streaming formats (HLS, HDS, DASH, Smooth)
  - Multiple device types from laptops to phones to gaming consoles
  - Inconsistent device performance capabilities
  - Inconsistent device compliance to industry specifications
- The result:
  - Content providers: Increased cost to prepare, store and support OTT
  - Device makers: Increased test and support costs for devices

# Commercial OTT Video Issues: WAVE Solution

## Content

### Content Specification

- Based on MPEG Common Media Application Format (CMAF)
- Compatible with DASH and HLS.

## Device Playback Capabilities

### Testable requirements

- covering most common playback interoperability issues.

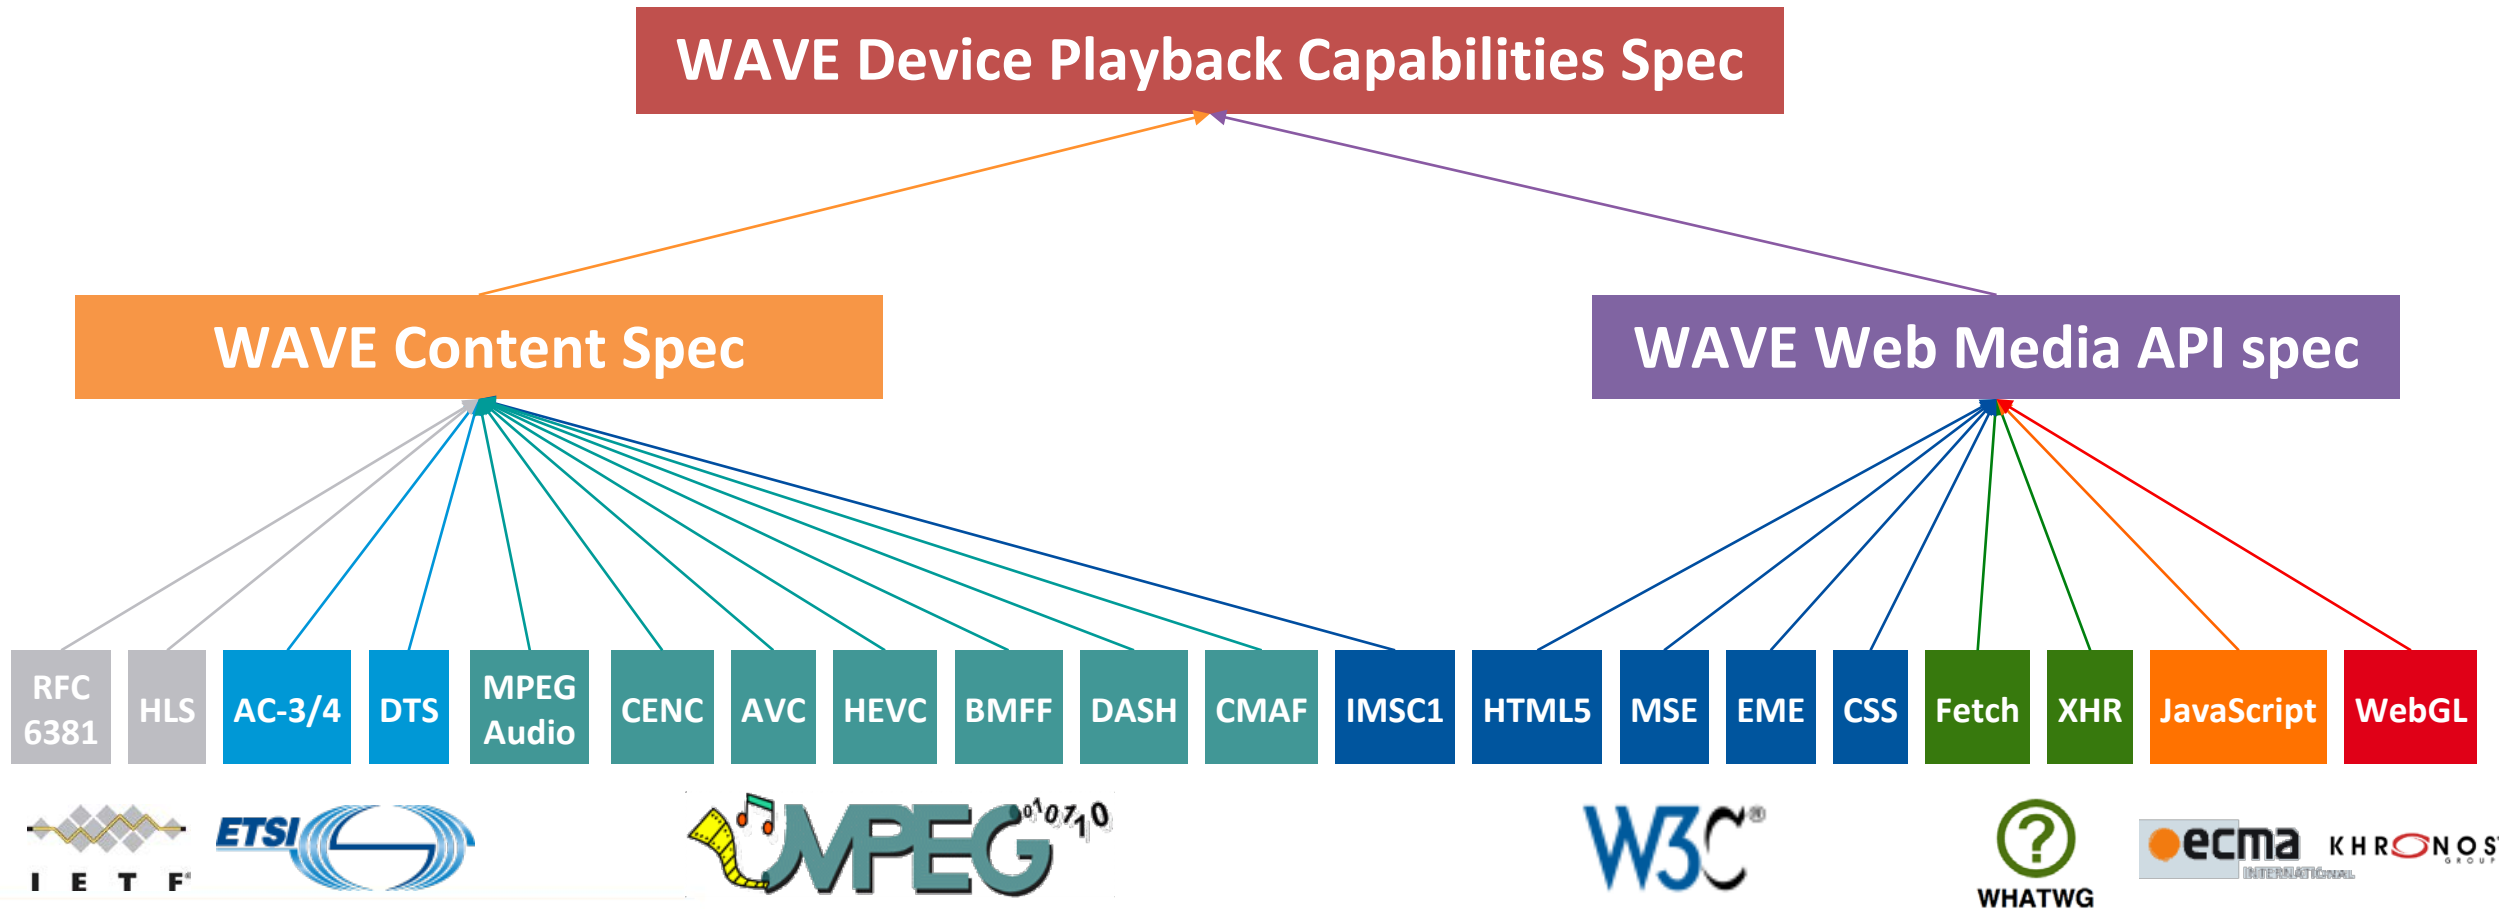

## Device HTML5 Reference Platform

### Reference application framework

- Based on HTML5
- Provides functional guidelines for playback interoperability.

## WAVE Test Suite

# WAVE bridges media standards & web standards

# Current WAVE Membership

Adobe Systems	<b>Comcast Cable</b>	MPAA	SpireSpark International
AGP	Cox Communications	Motion Picture Laboratories	<b>Starz</b>
<b>Akamai</b>	Discovery Communications	Mux	Streaming Video Alliance

# WAVE core technologies

JavaScript control of adaptive streaming

**HTML VIDEO**

HTML5 Media Extensions (MSE) – W3C

JavaScript interaction with DRM

HTML5 Encrypted Media Extensions (EME) – W3C

Manifest format

HTTP Live Streaming

**DASH**

**HLS**

Manifest independent encoding

**CMAF**

Common Media Application Format – ISO MPEG CMAF

DRM-Interop encode/decode

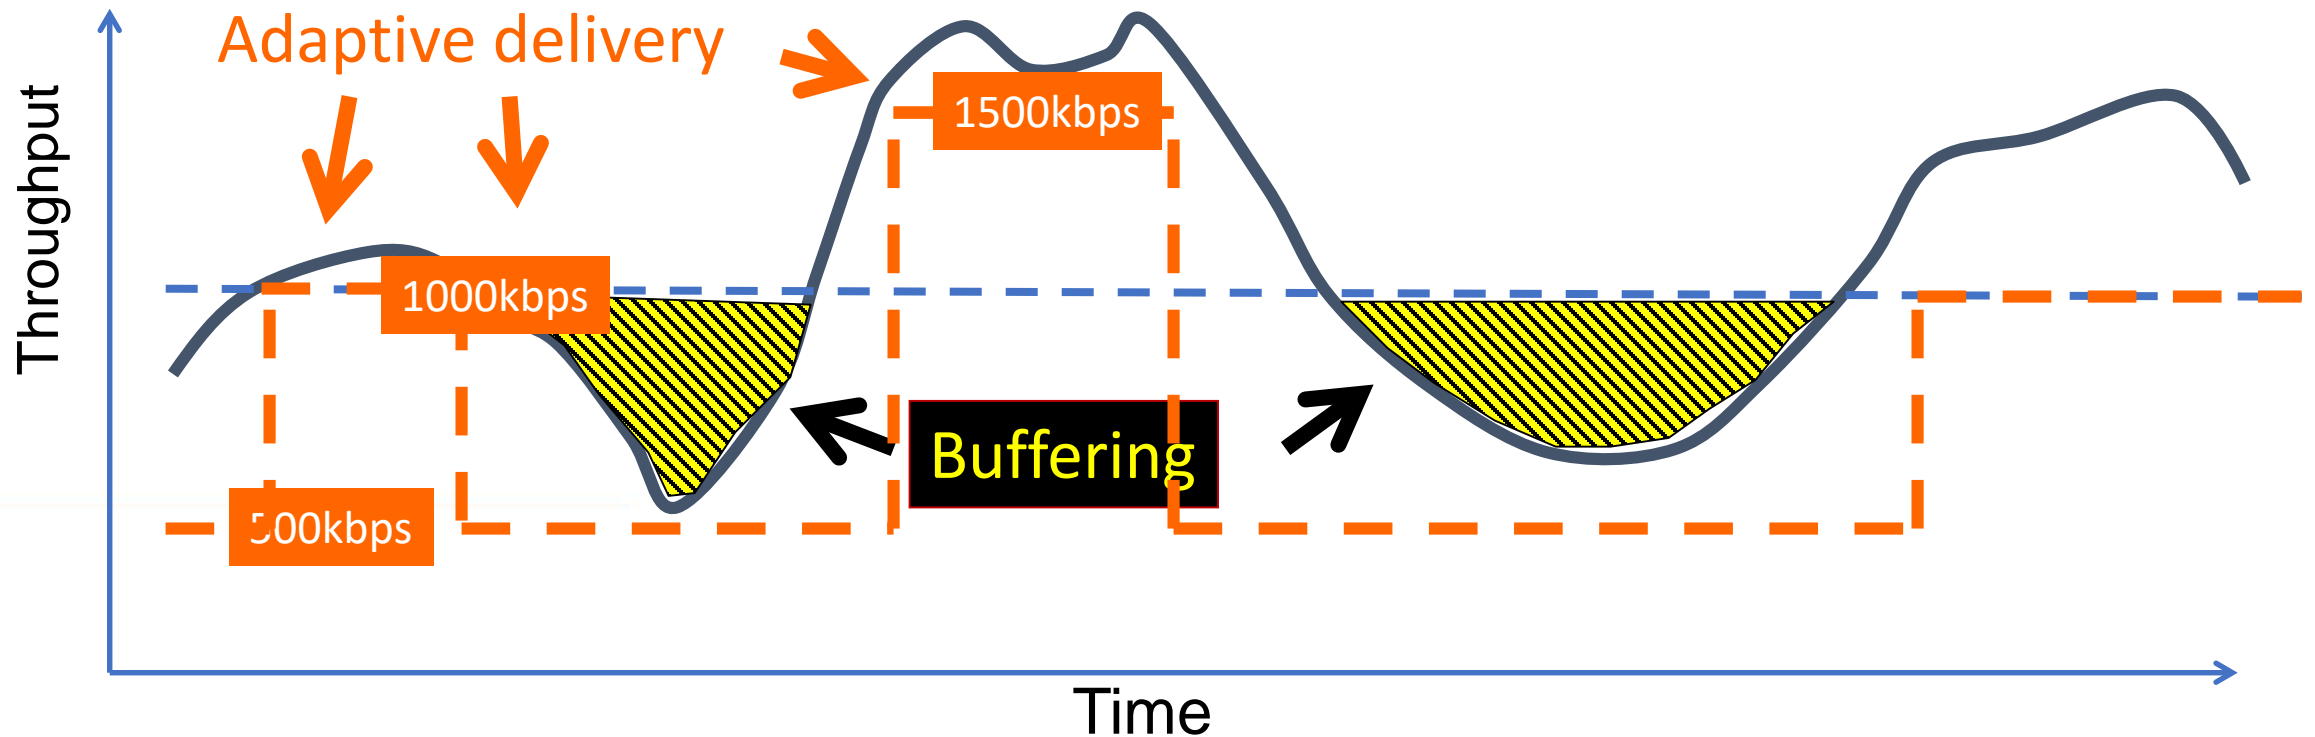

Common Encryption

**CENC**

ISO MPEG CENC

# Adaptive Segmented Media

- The internet does not offer a fixed QoS. Throughput (goodput) fluctuates constantly over the timescale of video content delivery
- Ideally we would like to switch bitrates constantly to always give the user the highest quality they can sustain at any point in time.

# How does segmentation work?

1 Incoming video

2

is split by an encoder

3

into multiple short blocks. Each block holds the same section of video, encoded at a different size and bitrate.

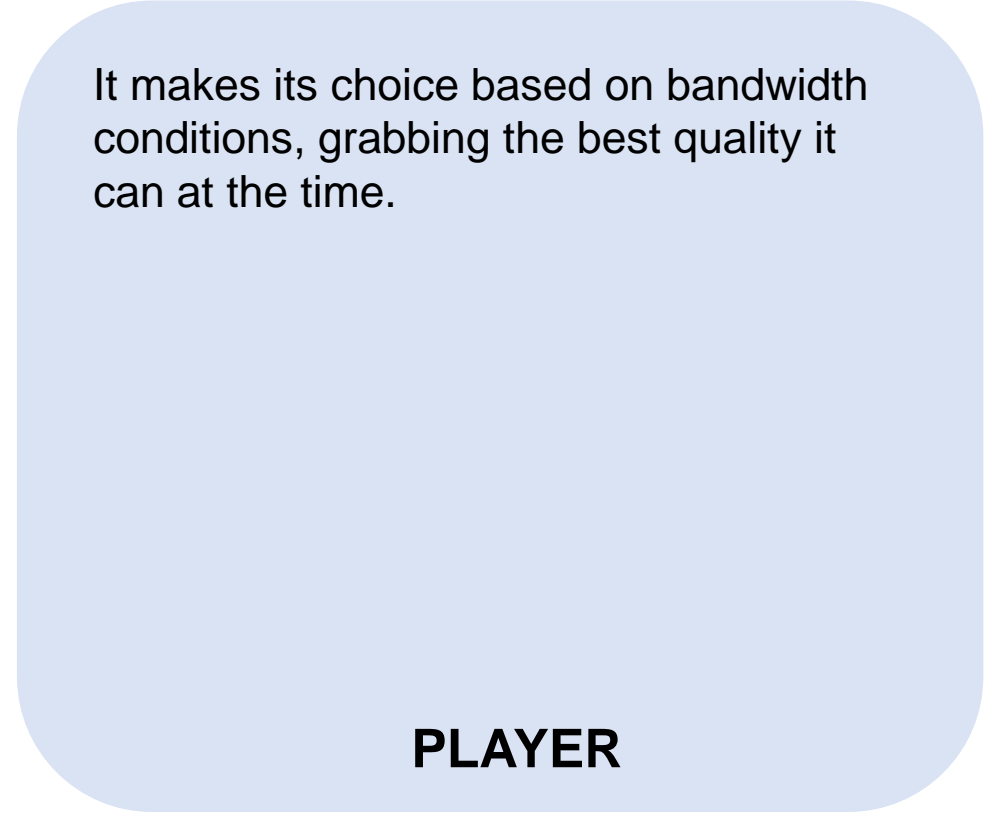

# How does adaptive delivery work?

The segmented video is stored on a server, along with a text file which describes the names of each segment. This text file is called a **manifest**.

A player downloads the manifest and then begins requesting individual segments of video.

# How does adaptive delivery work?

The segmented video is stored on a server, along with a text file which describes the names of each segment. This text file is called a **manifest**.

A player downloads the manifest and then begins requesting individual segments of video.

**SERVER**

**CLOUD**

It makes its choice based on bandwidth conditions, grabbing the best quality it can at the time.

**PLAYER**

# Adaptive Segmented Media Formats

**MOVE Networks - 2007**

**Microsoft Smooth Streaming - 2008**

**Apple HTTP Live Streaming (HLS) - 2009**

**Adobe HDS - 2010**

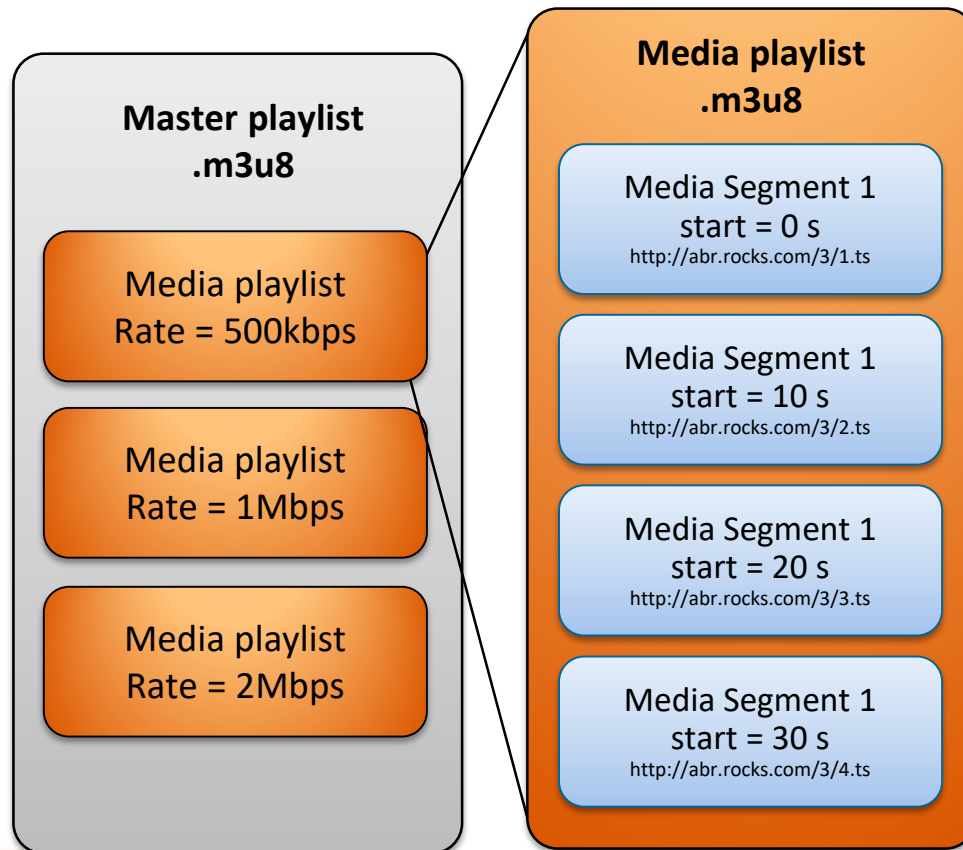

**MPEG DASH - 2012**

# Adaptive Segmented Media Formats

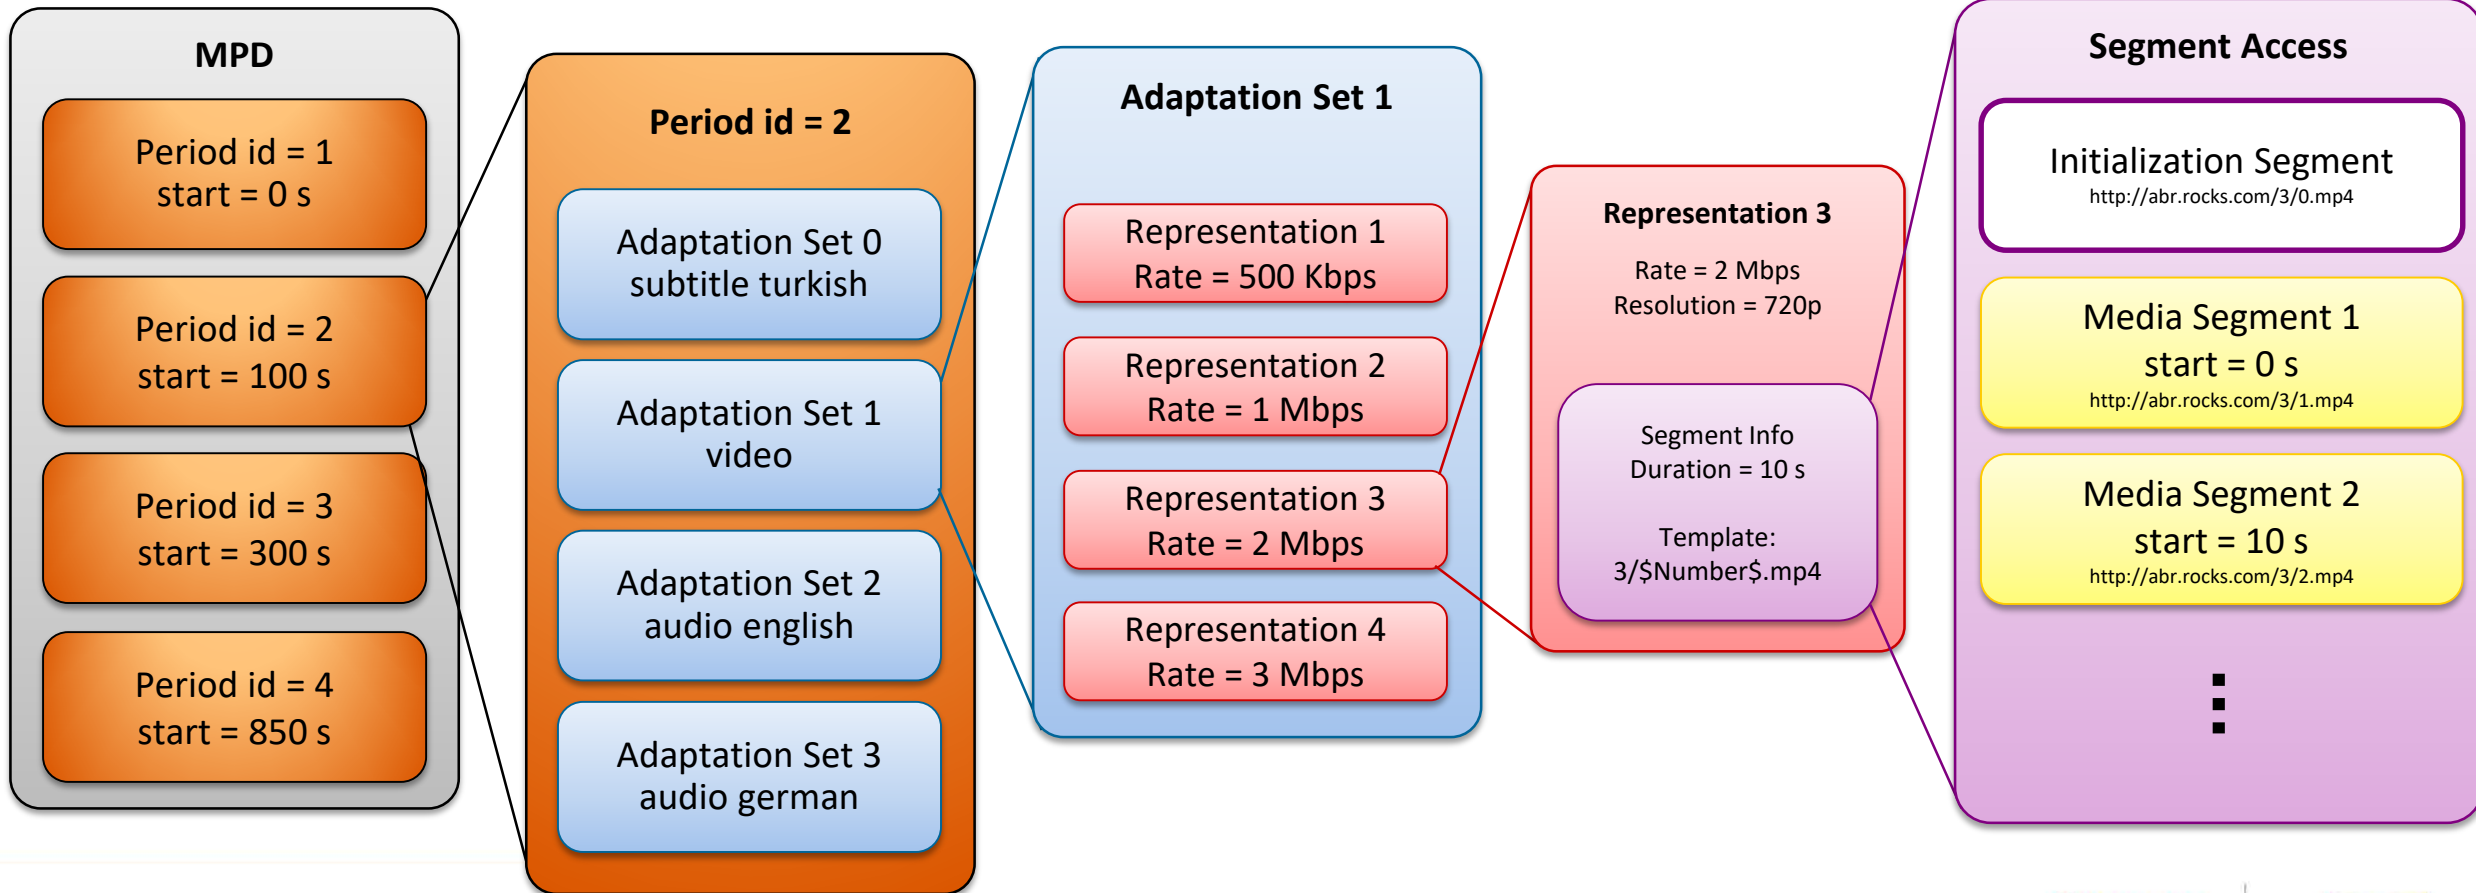

**Apple HTTP Live Streaming (HLS) - 2009**

**MPEG DASH - 2012**

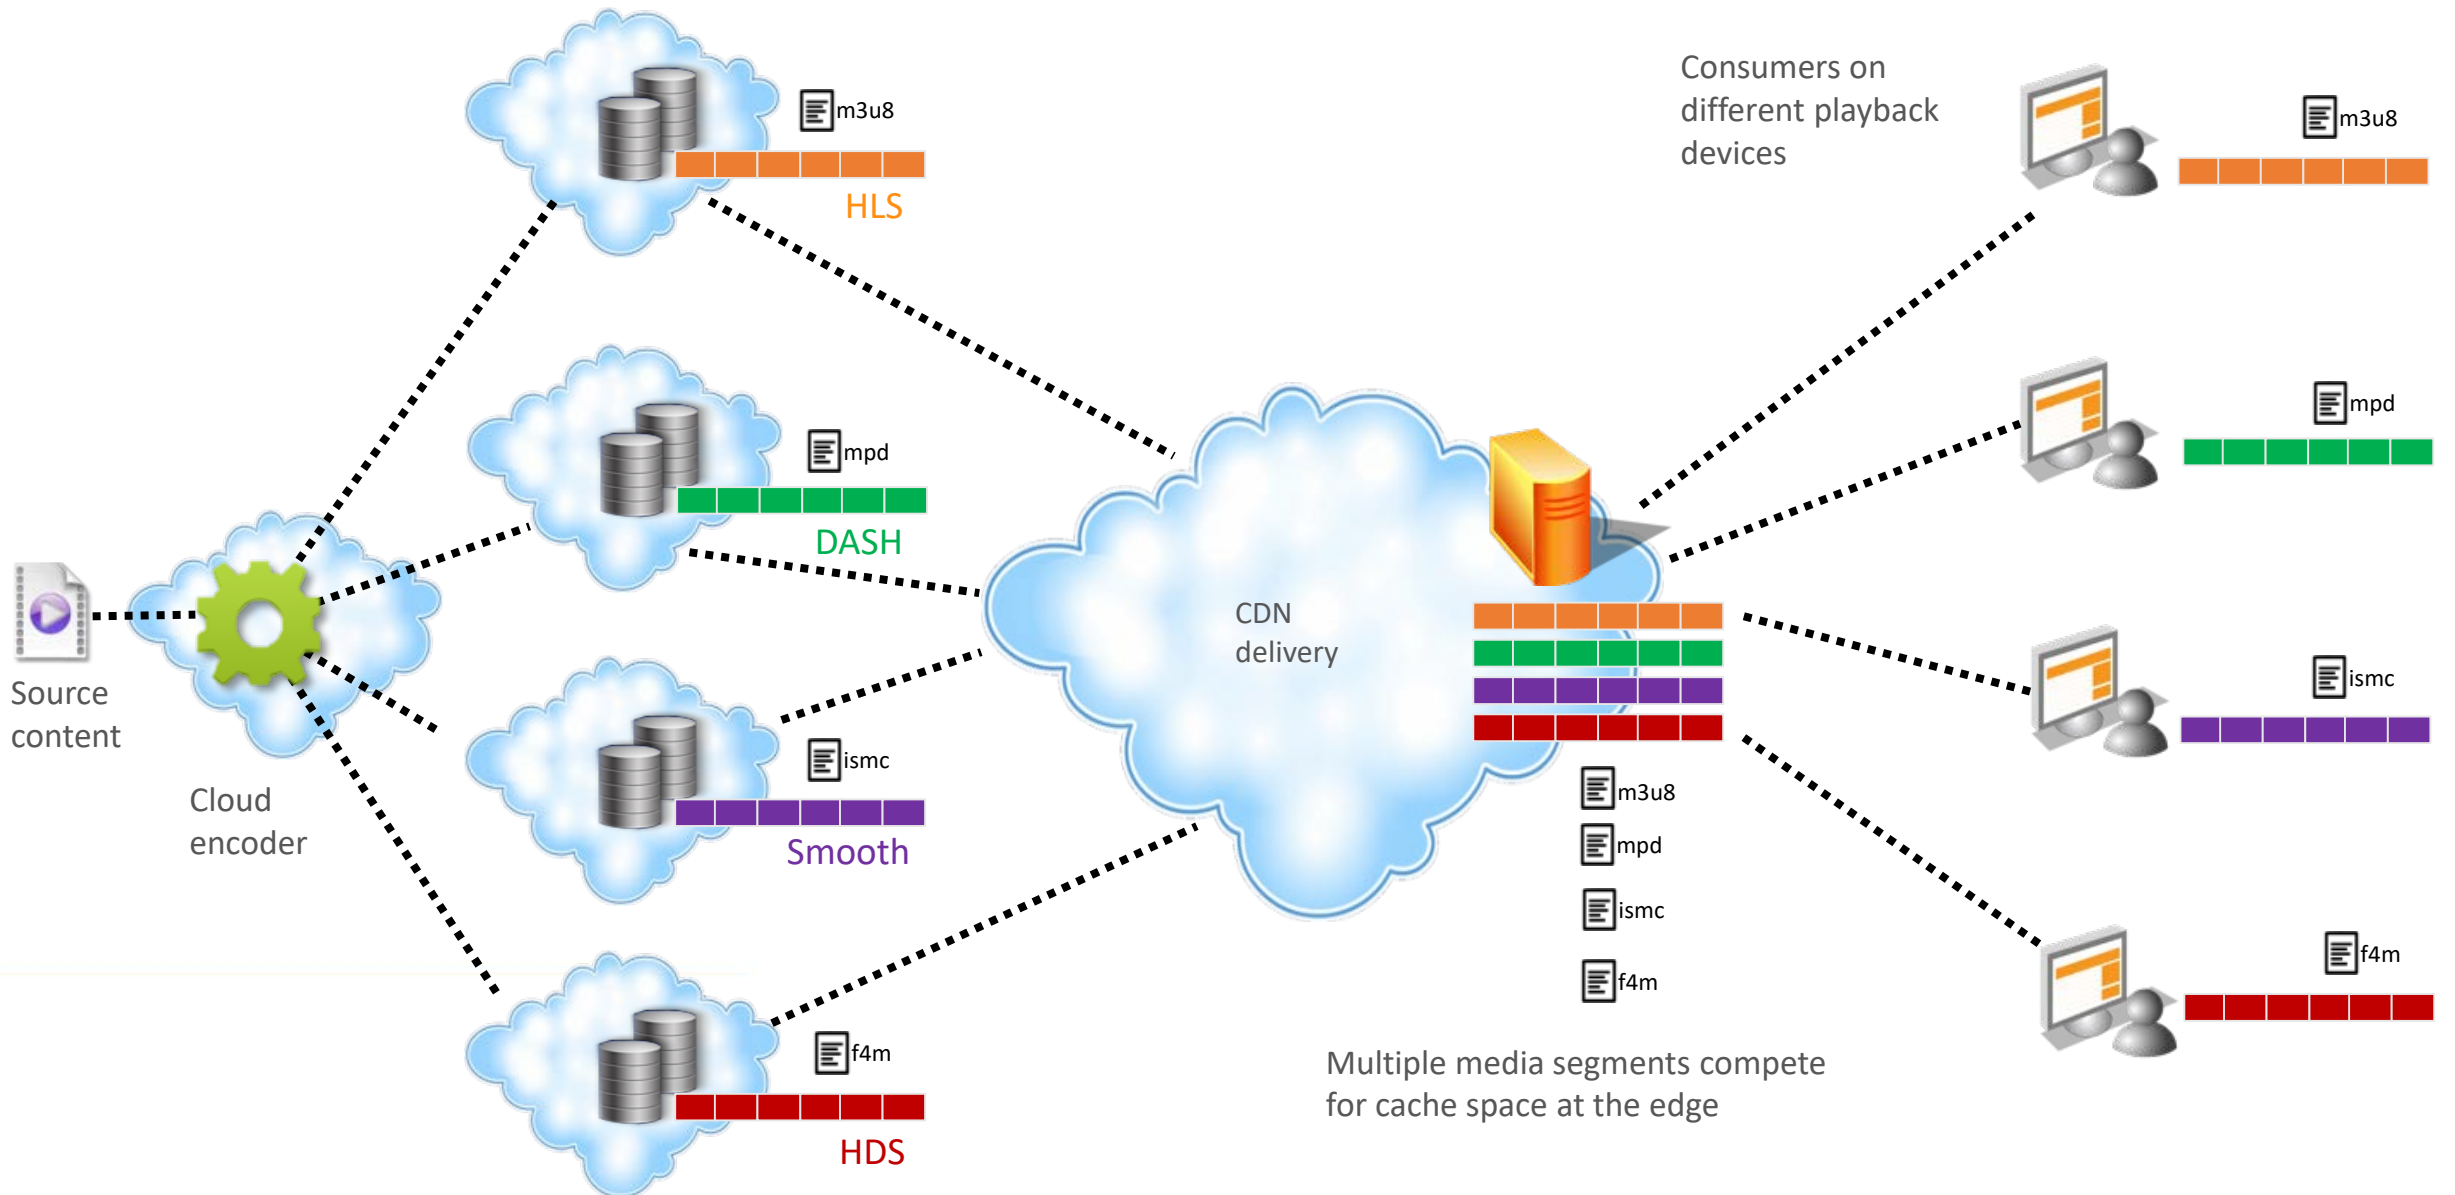

# HLS– object hierarchy

# MPEG DASH – object hierarchy

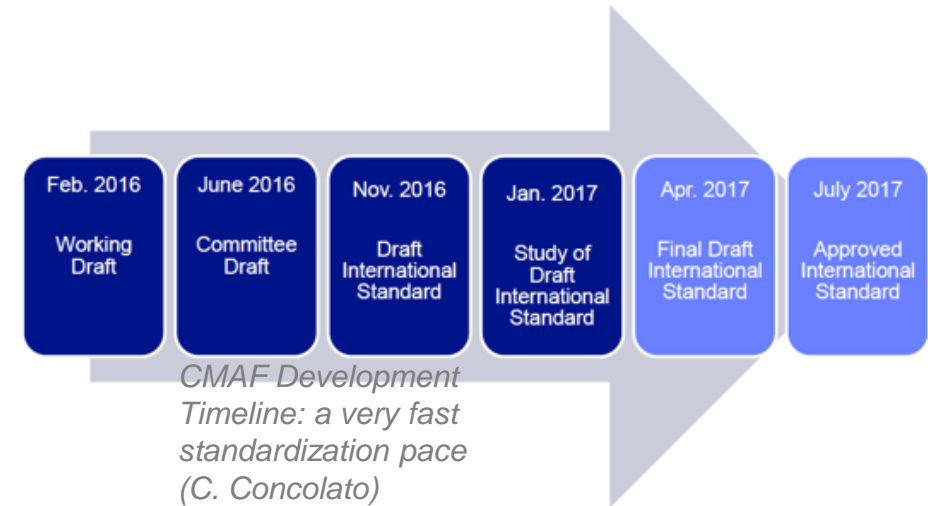

# CMAF – Multi-platform OTT workflow today

# CMAF History and Roadmap

- In January 2015, **Microsoft and Apple** proposed a new media format which would be common between HLS and DASH.
- Worked with other companies to develop the format.

- Proposed Feb 2016 at MPEG's 114<sup>th</sup> meeting.
- “Requirement Proposal” presented by:
  - Adobe, Akamai, Apple, BBC, Cisco, Comcast, DTG, Ericsson, Fraunhofer, iStreamPlanet, LG Electronics, Microsoft, MLBAM, Qualcomm, Samsung, Starz, Telecom Italia, Turner, Verimatrix, WWE.
- “Draft Specification” presented by:
  - Apple, Microsoft, MLBAM, Cisco, Akamai and Comcast.
- MPEG approved the establishment of a new standard:

**ISO/IEC 23000-19 - Common Media Application Format**

Consumer  
Technology  
Association

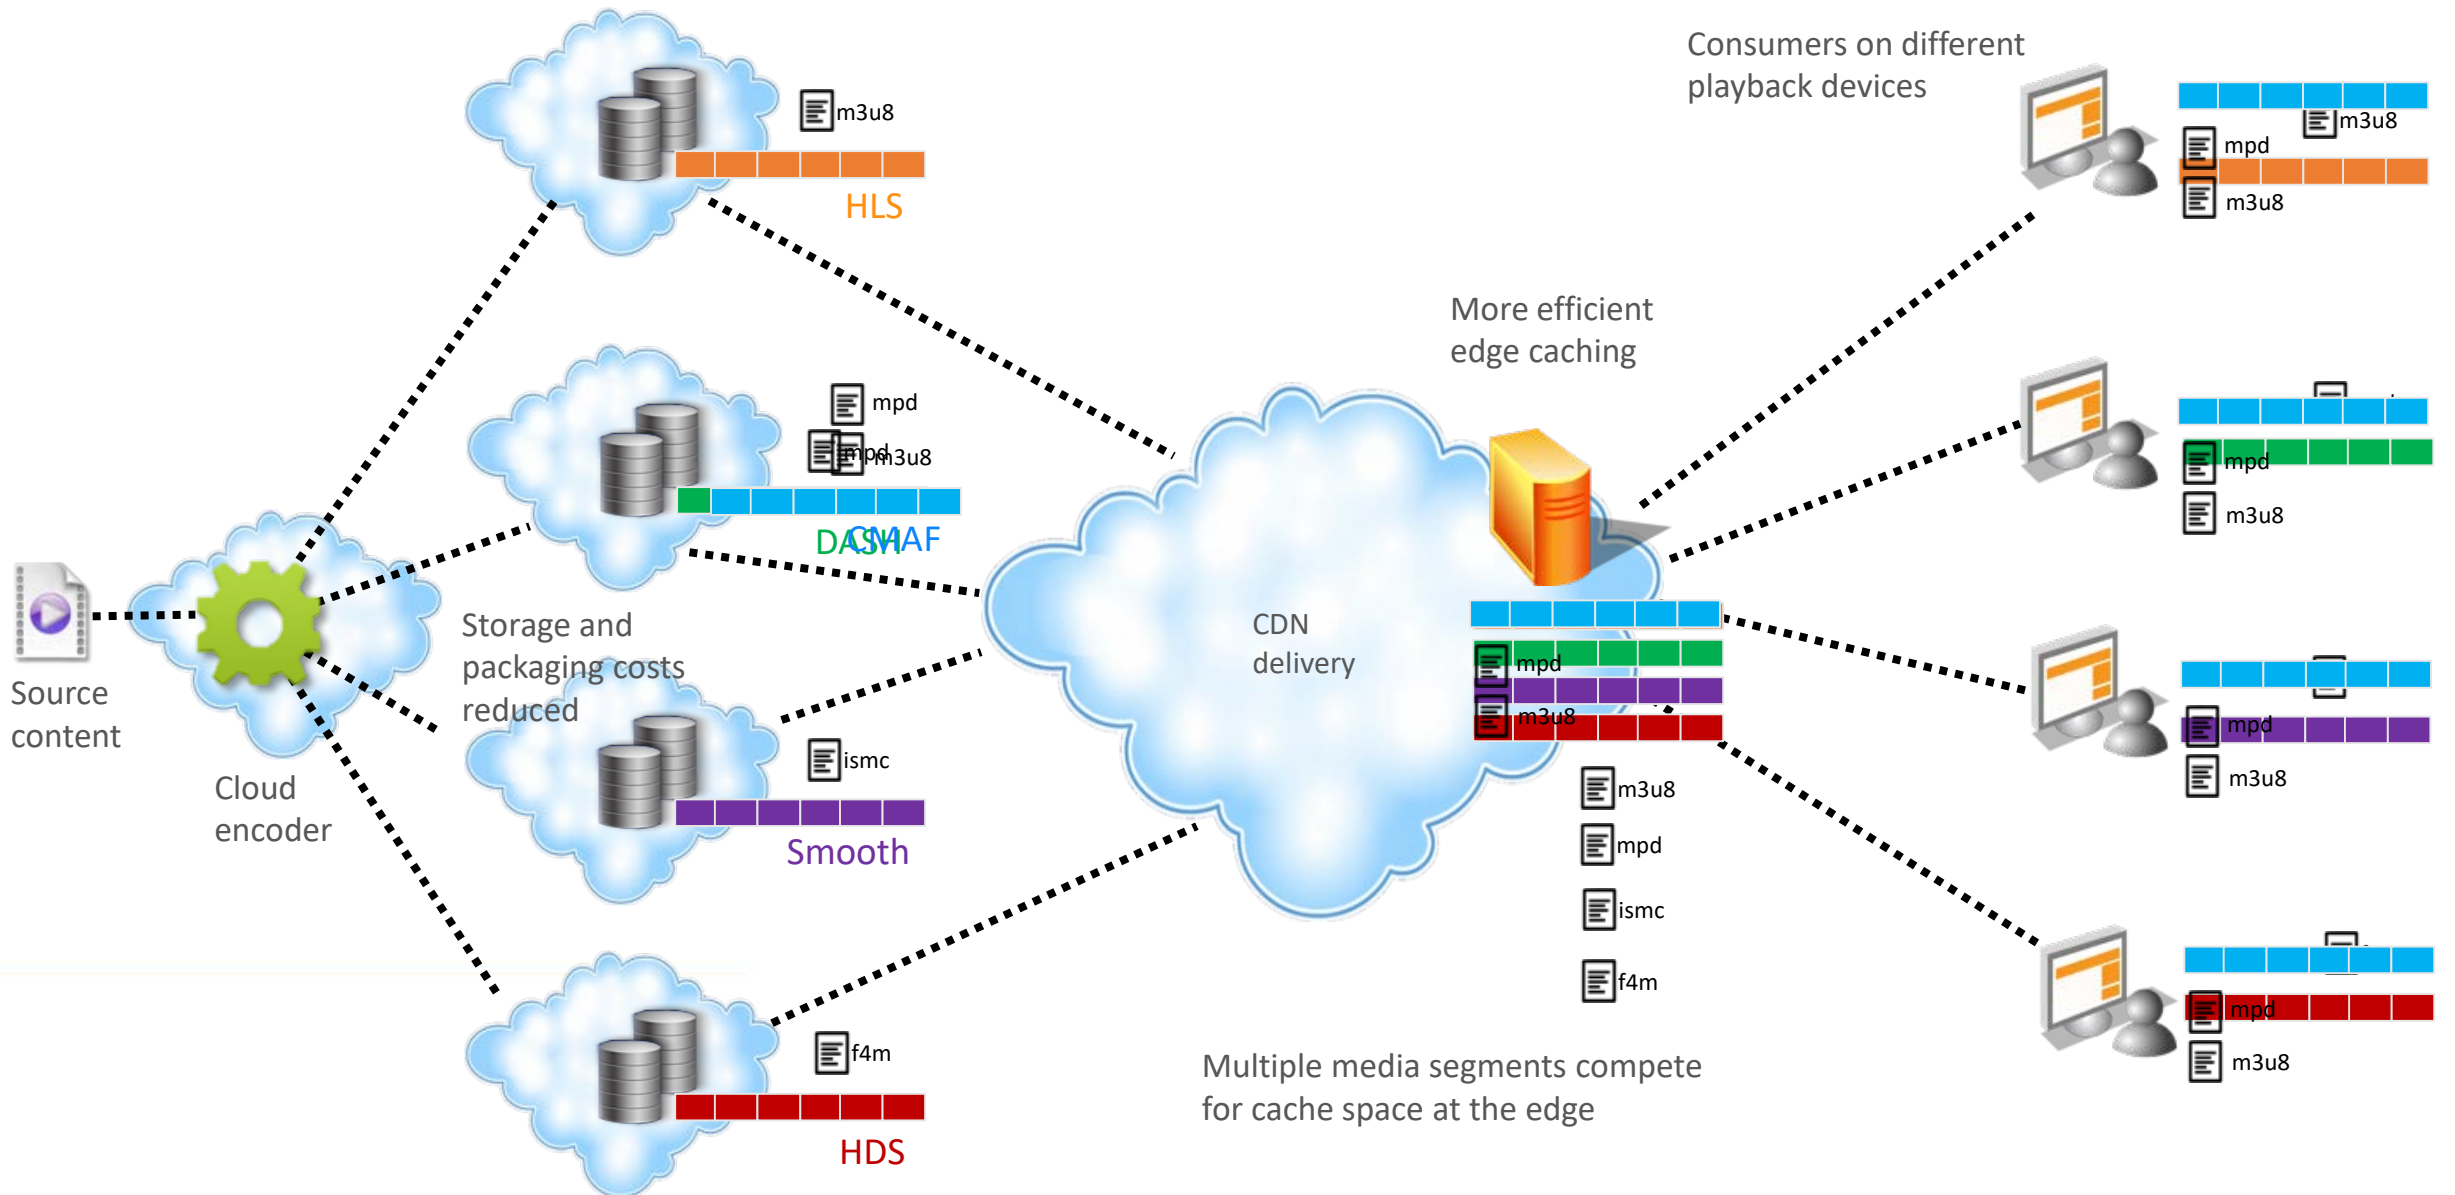

# CMAF Scope

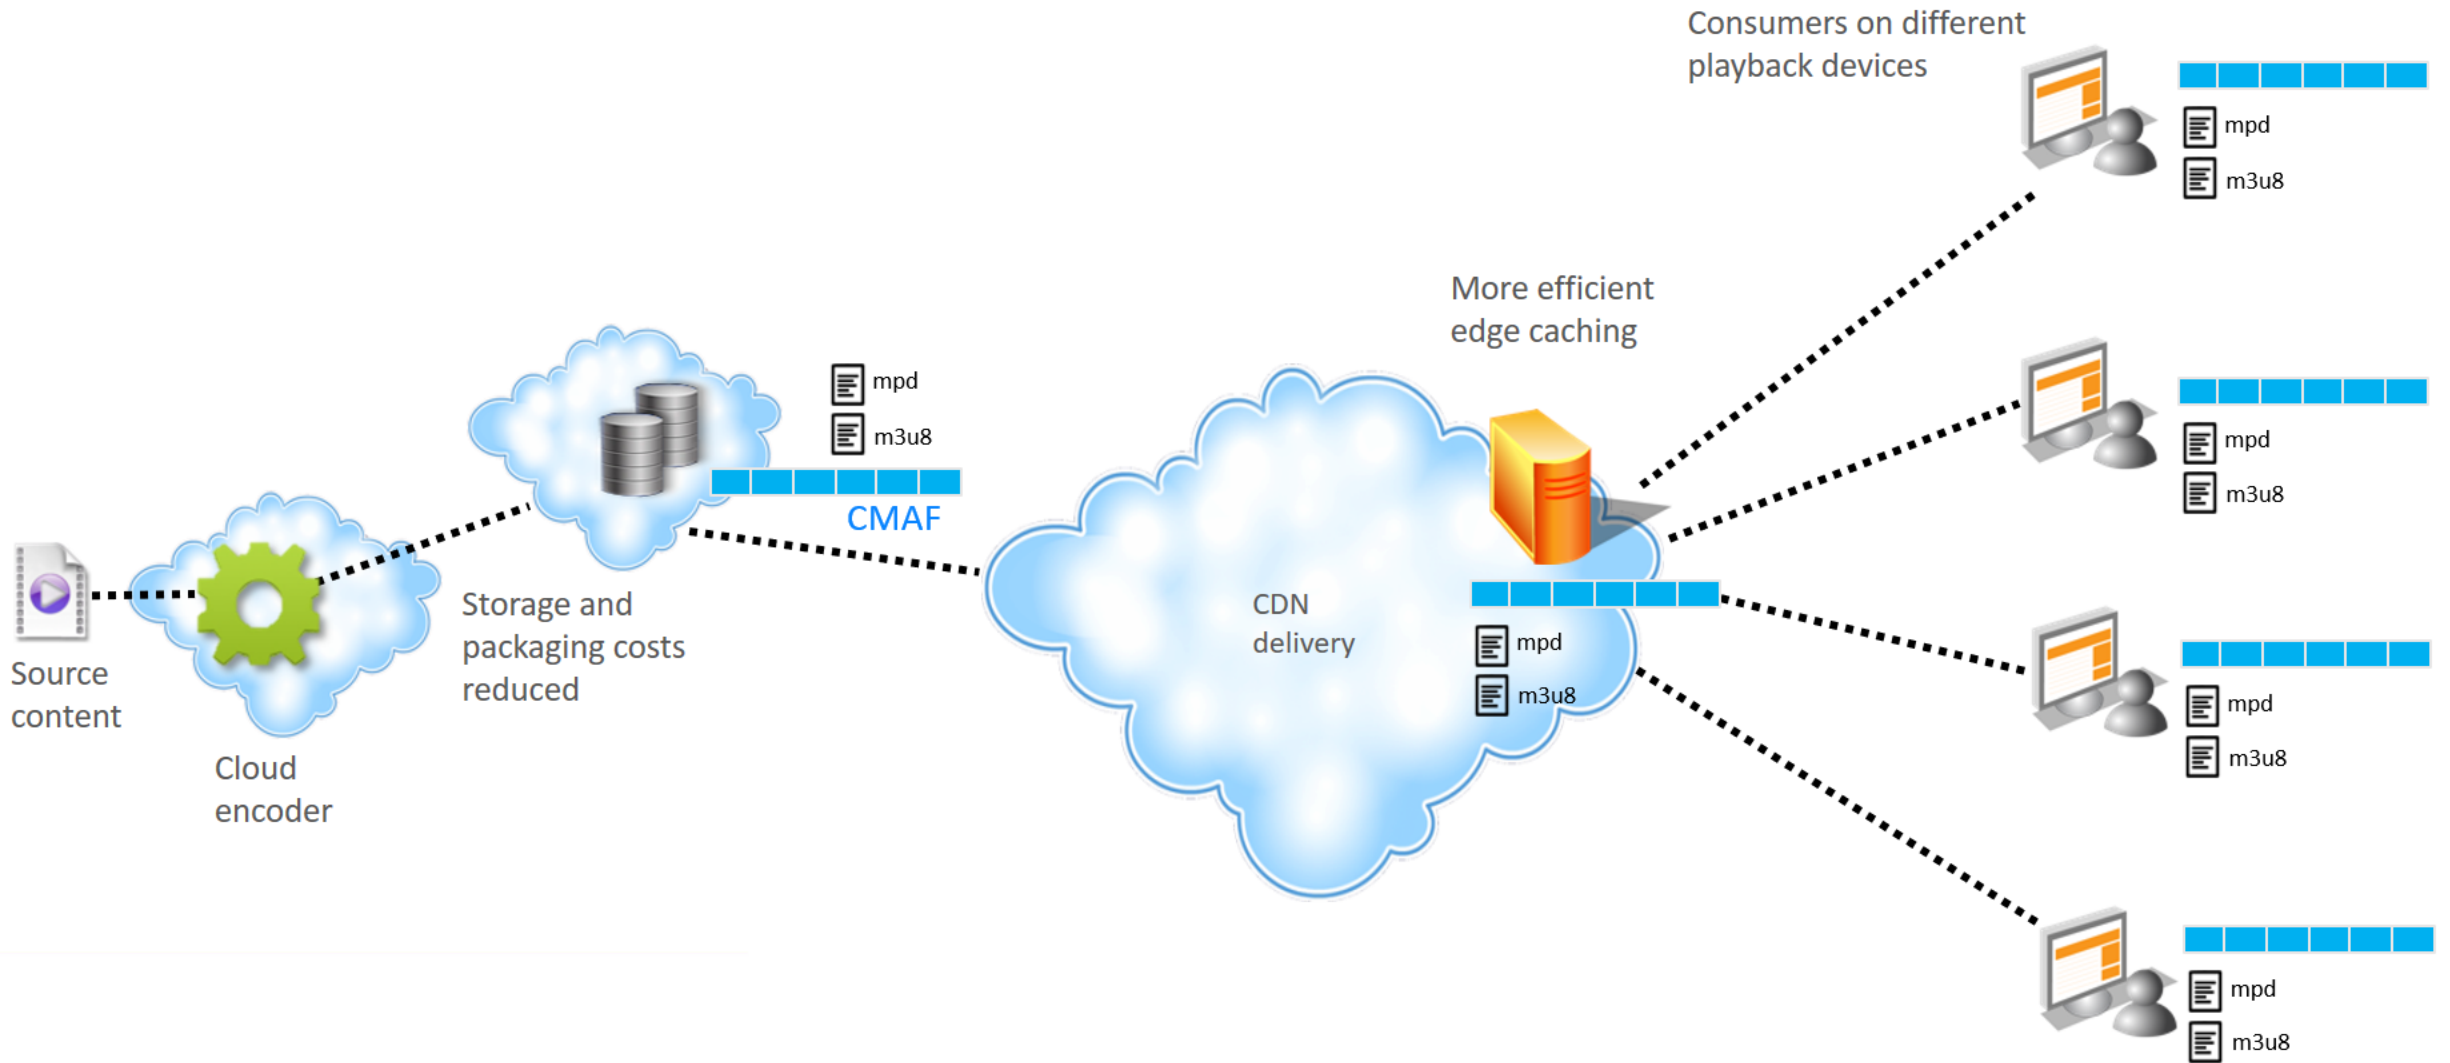

The Common Media Application Format defines the **container that holds the audio and video content**. It is not another presentation format itself.

# Multi-platform OTT workflow with CMAF

# Multi-platform OTT workflow with CMAF

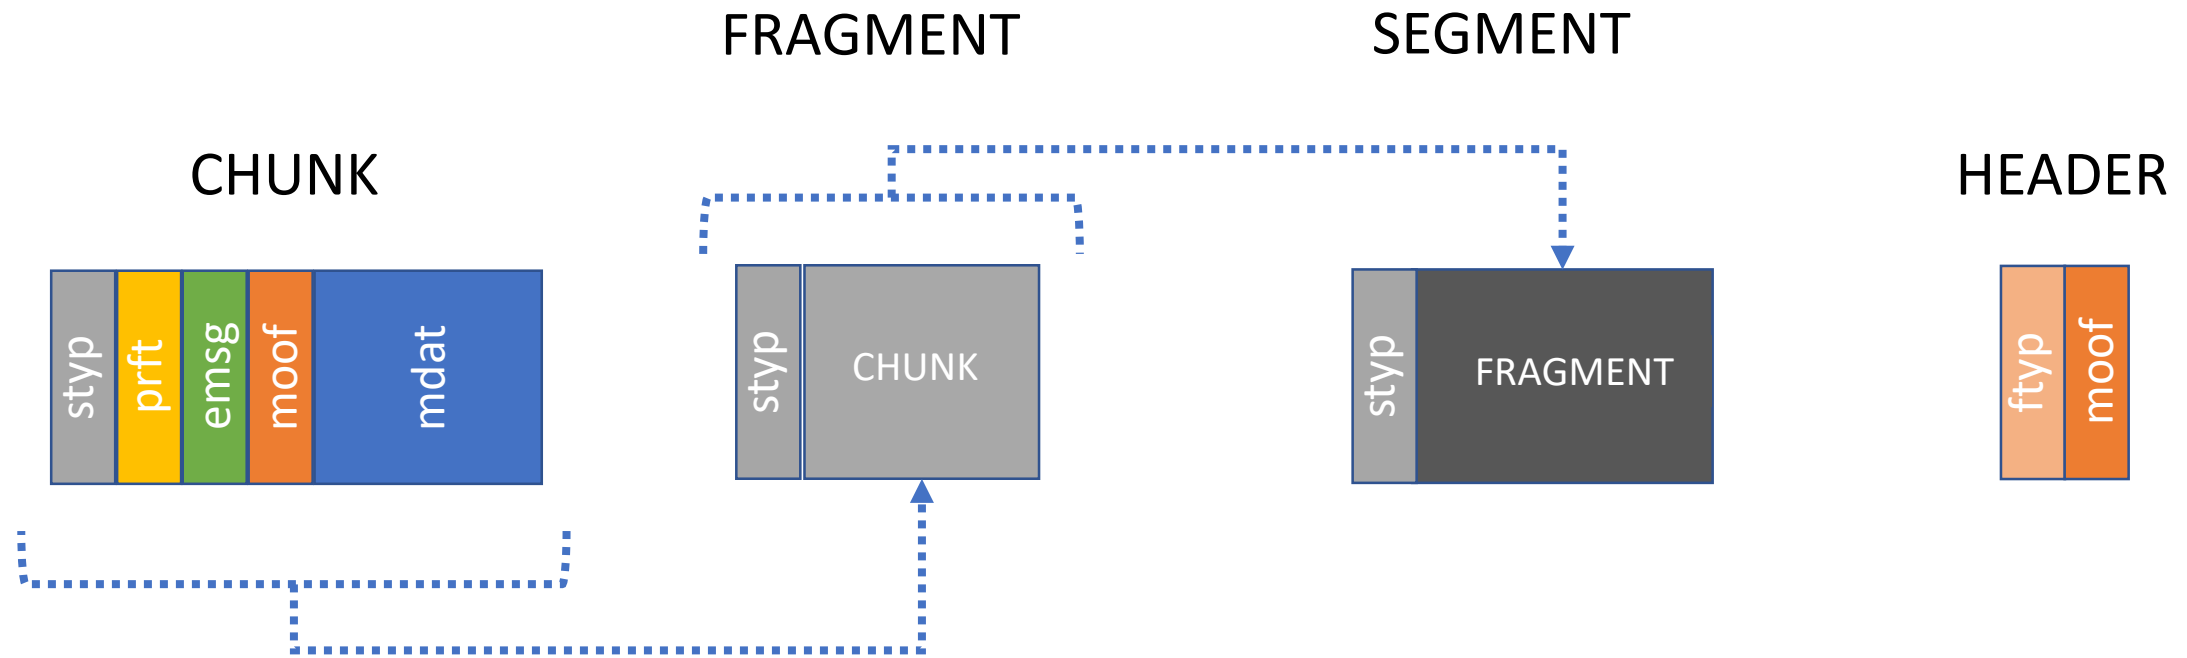

# Core Technologies

- **ISOBMFF**, fMP4 container, specifically ISO/IEC 14496-12:201
- Common Encryption (**CENC**) - ISO/IEC 23001-7: 2016
  - Allows “cenc”, “cbcs”, “cens” and “cbc1” modes of operation
- Supports the MPEG codec suite of
  - **AVC** (ISO/IEC 14496-10),
  - **AAC** (ISO/IEC 14496-3) and
  - **HEVC** (ISO/IEC 23008-2) codecs

...in a baseline interoperability but allows other audio and video codecs (such as VP9 or Dolby AC4) to be signaled.
- Supports captioning and subtitles: **TTML IMSC1, WebVTT (CEAx08 allowed)**

# Media Object Box Tables - Components

# Logical Media Objects for delivery

# CMAF Defined brands

Brand	Location	Conformance Requirements
'cmfc'	FileTypeBox and SegmentTypeBox	CMAF Header CMAF Track Format
'cmfs'	SegmentTypeBox	CMAF Segments
'cmfl'	SegmentTypeBox	CMAF Chunks
'cmff'	SegmentTypeBox	CMAF Fragment (containing the first samples of the CMAF Fragment)

# CMAF Presentation Profiles

## [urn:mpeg:cmaf:presentation\\_profile:cmfhd:2017](#)

- At least 'cfhd' (HD video)
- At least 'caac' (AAC core audio)
- At least 'im1t' (IMSC1 Text subtitles)
- Not encrypted

## [urn:mpeg:cmaf:presentation\\_profile:cmfhdc:2017](#)

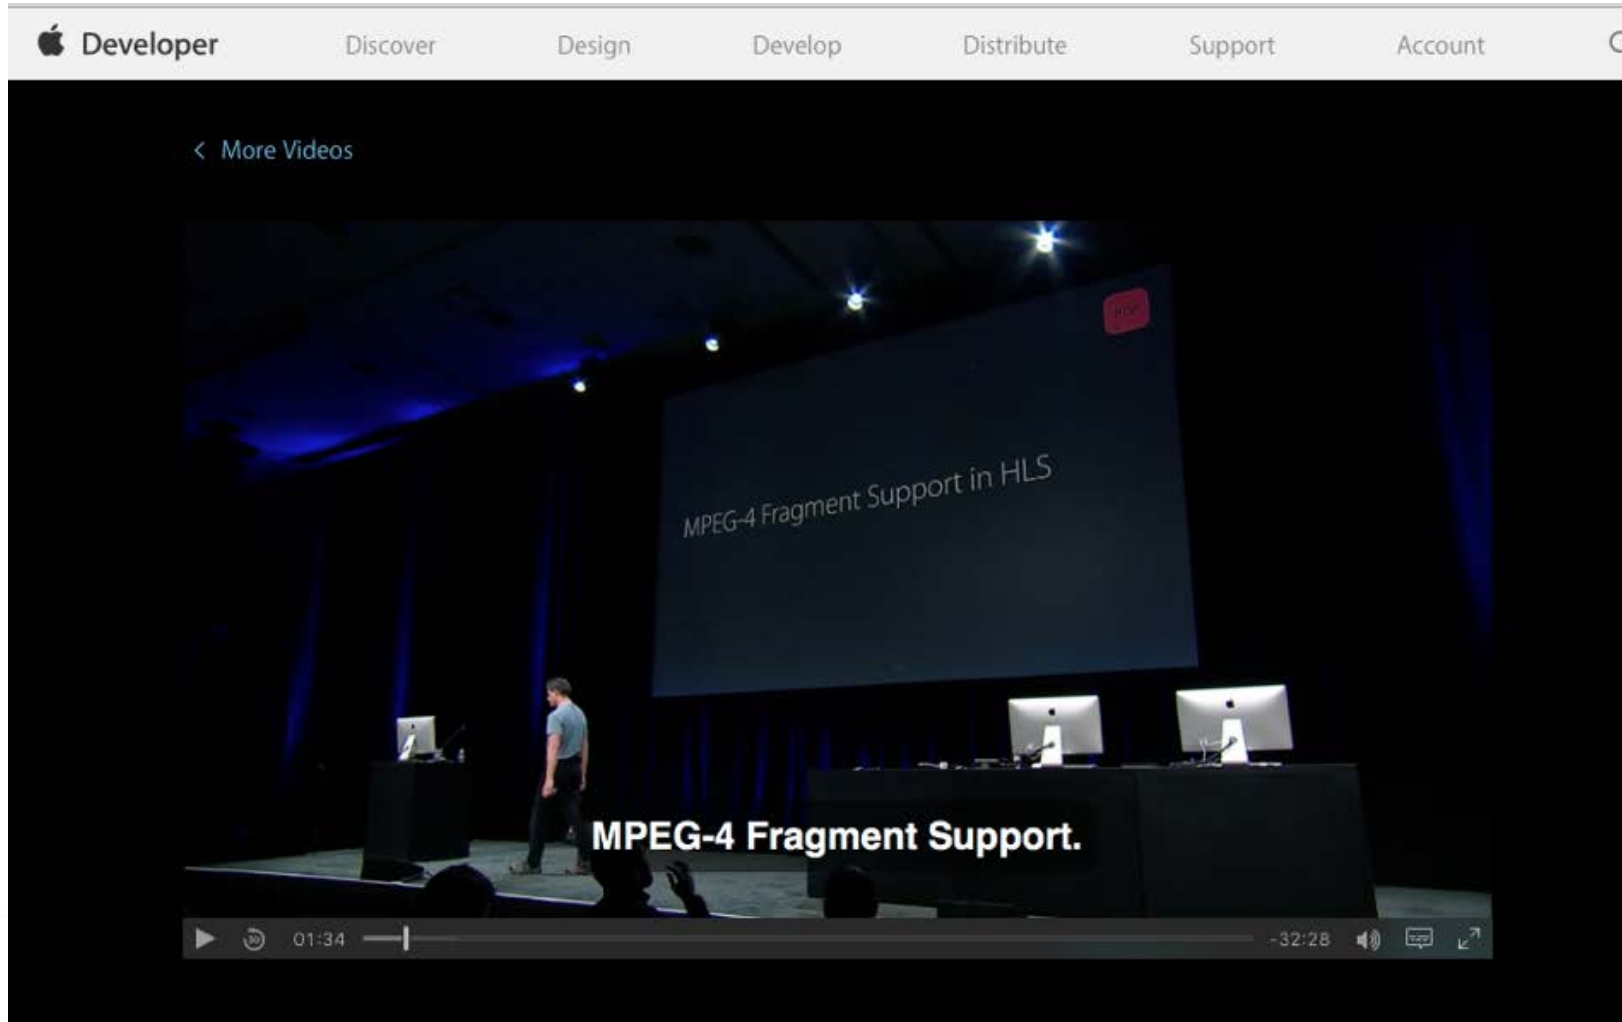

- CMFHD but with at least one 'cenc' encrypted media

## [urn:mpeg:cmaf:presentation\\_profile:cmfhds:2017](#)

- CMFHD but with at least one 'cbcs' encrypted media

# Apple Support

Apple @ WWDC, June 2016:  
*“Fragmented MPEG-4 (fMP4) will be added as a Segment format to the HLS spec, and that it will be supported on all Apple HLS clients.”*

Compatibility to CMAF and DASH ISO BMFF segment formats is available beginning with the following software releases: macOS 10.12, iOS 10, tvOS 10 (*released September 13<sup>th</sup> 2016*)

AES-128 commonly encrypted audio  
or video payload

# Common Encryption ISO/IEC 23001-7:2016

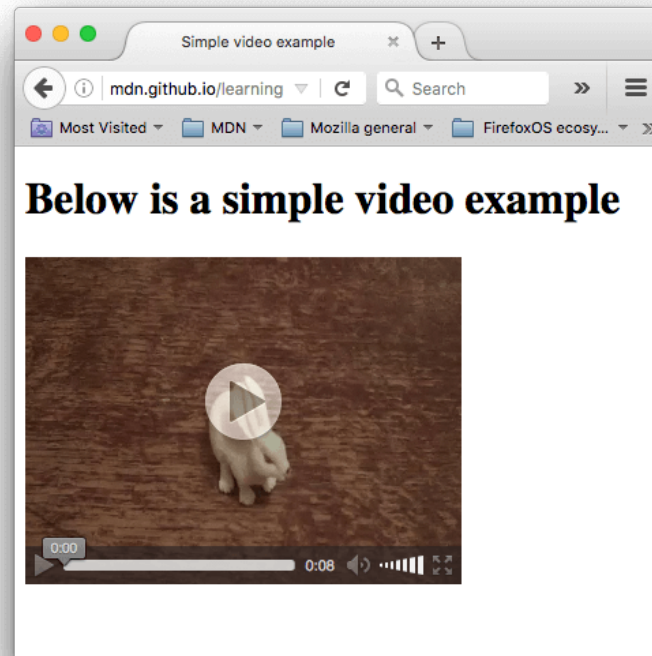

Unfortunately, there are 4 versions of AES-128 encryption that are allowed:

- **CENC AES-CTR** or **cenc**: CENC Protection Scheme using AES 128-bit keys in Counter Mode (AES-128 CTR)
- **CENC AES-CBC** or **cbc1**: CENC Protection Scheme using AES 128-bit keys in Cipher-block chaining mode (AES-128 CBC)
- **CENC AES-CTR Pattern** or **cens**: CENC Protection Scheme using AES 128-bit keys in Counter Mode (AES-128 CTR) using pattern of unencrypted/encrypted bytes
- **CENC AES-CBC Pattern** or **cbcs**: CENC Protection Scheme using AES 128-bit keys in Cipher-block chaining mode (AES-128 CBC) using pattern of unencrypted/encrypted bytes

...but only two versions are allowed in WAVE.

# HTML Video

# Media Source Extensions (MSE)

1. <https://www.w3.org/TR/media-source/>
2. This specification extends HTMLMediaElement to allow JavaScript to generate media streams for playback.
3. Allows the creation of <audio>, <video> and <text> source buffers.
4. Delivery is format agnostic.

# Encrypted Media Extensions (EME)

1. W3C standard <https://www.w3.org/TR/encrypted-media/>
2. This proposal extends HTMLMediaElement providing APIs to control playback of protected content.
3. The API supports use cases ranging from simple clear key decryption to high value video (given an appropriate user agent implementation). License/key exchange is controlled by the application, facilitating the development of robust playback applications supporting a range of content decryption and protection technologies.

# Which browser code bases support MSE today?

## Media Source Extensions - CR

API allowing media data to be accessed from HTML video and audio elements.

Usage % of all users

# HTML5 players....many choices!

# Content Specification

WAVE Device Playback Capabilities Spec

WAVE Content Spec

WAVE Web Media API spec

# WAVE Content in Context

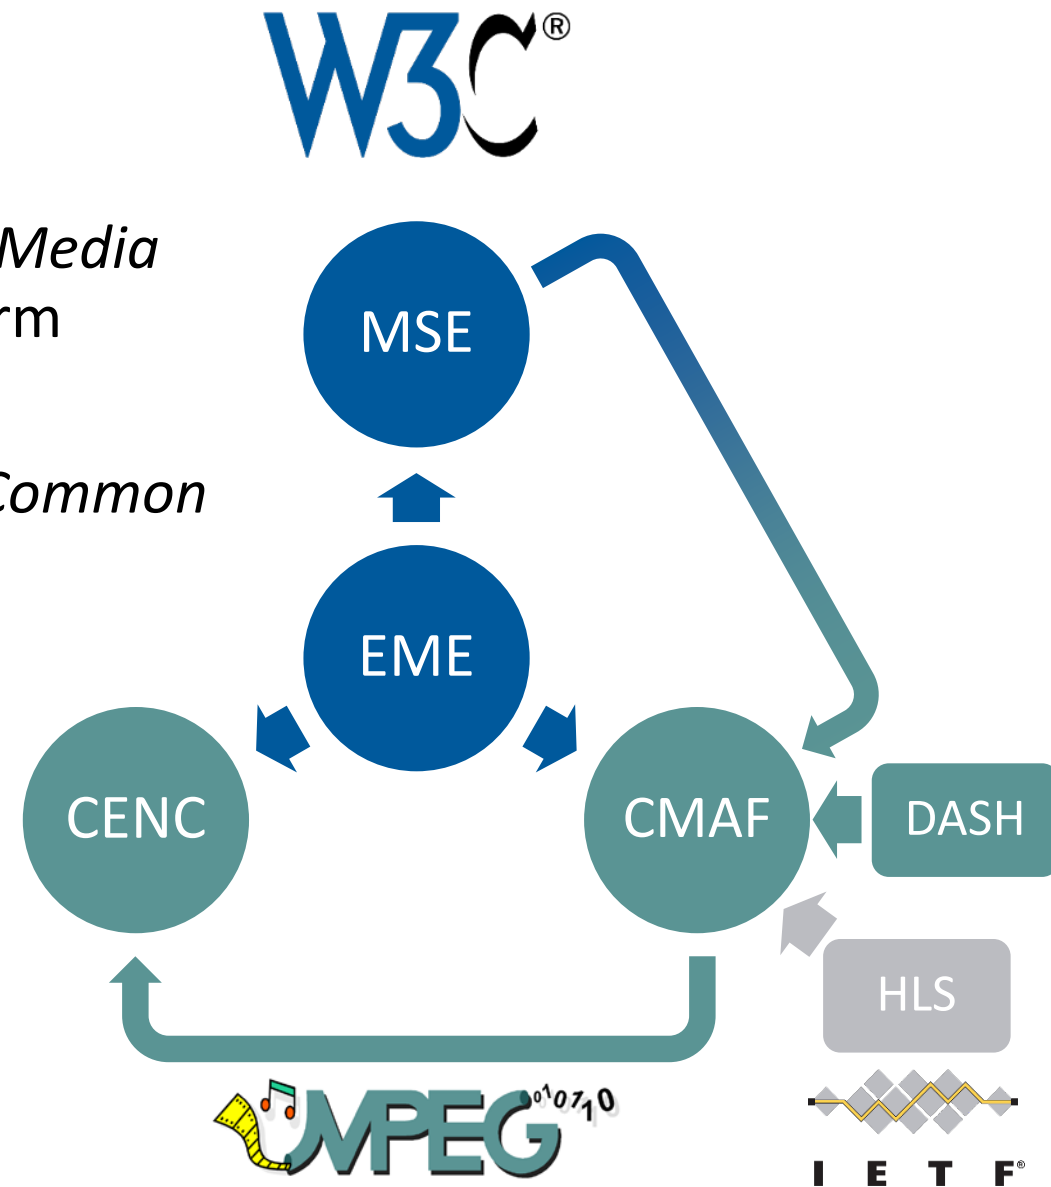

HTML5 *Media Source Extensions (MSE)* and *Encrypted Media Extensions (EME)* work together to enable cross-platform commercial media web apps

**MSE** works with segmented media formats like *MPEG Common Media Application Format (CMAF)*.

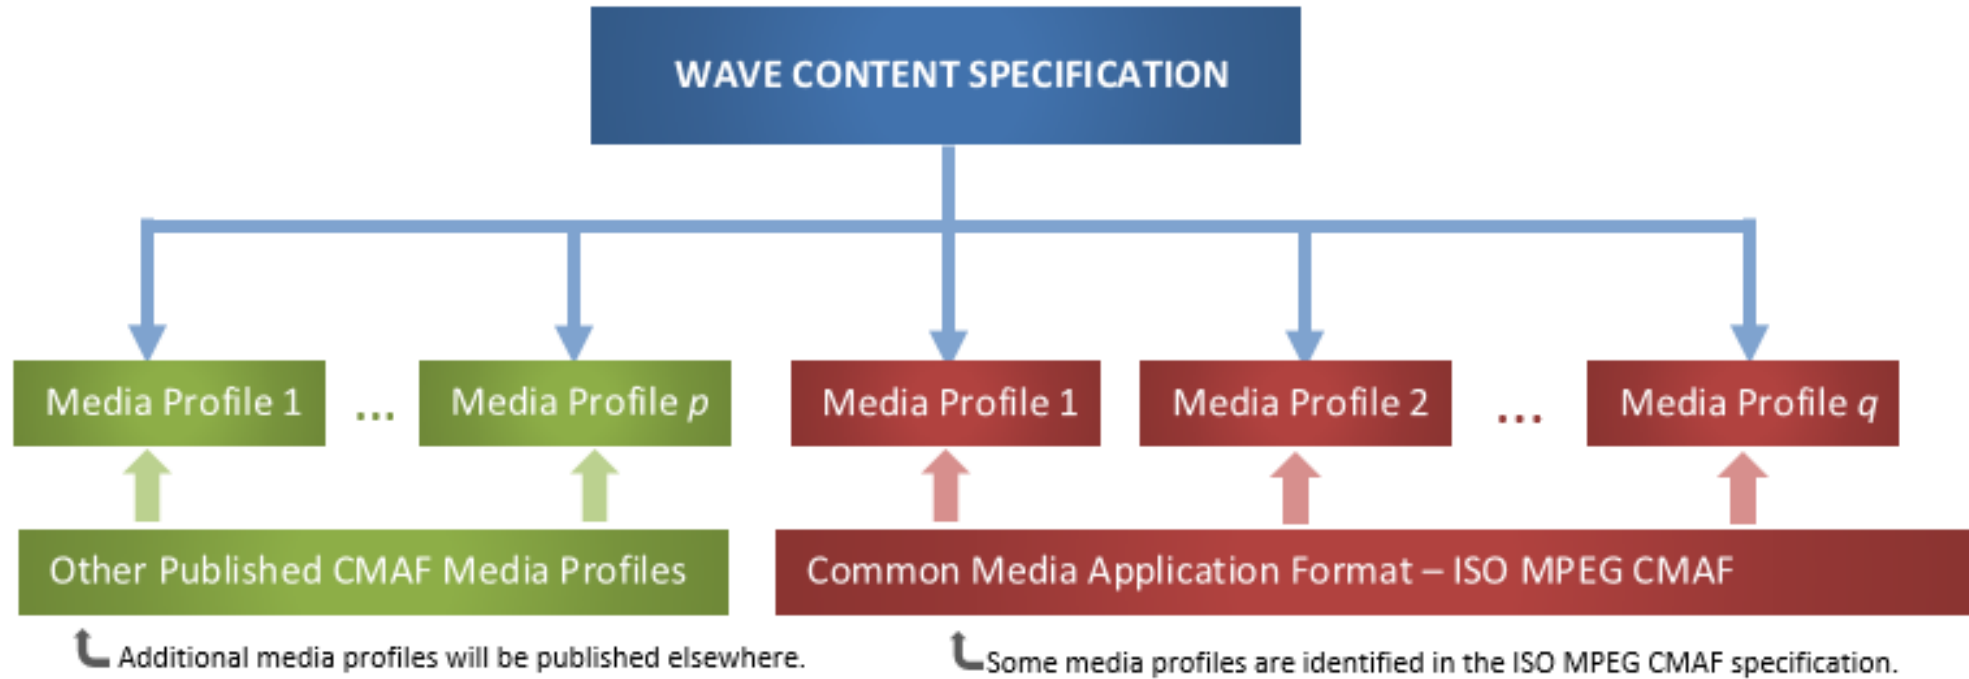

**CMAF** supports DRM-interop using *MPEG Common Encryption (CENC)*; both work with **EME**.

Media presentations can be delivered with *MPEG Dynamic Adaptive Streaming over HTTP (DASH)* or Apple's IETF-published *HTTP Live Streaming (HLS)*; both work with **CMAF**.

WAVE exists because the well-coordinated, global adoption of these standards can transform both the broadcast and Internet industries.

# WAVE Content Spec and Published CMAF Media Profiles

- CMAF presentations can be constructed from a variety of codecs – the binding to the CMAF container format is called a "Media Profiles".
- CMAF defines 1) CMAF bindings for a variety of MPEG codecs, 2) extensibility for bindings outside MPEG.
- WAVE has an objective process to qualify Media Profiles for the WAVE Content Specification
  - Market relevance, MSE compatibility, and schedule for availability of test tools / test content.
  - WAVE's adoption of new Media Profiles is an ongoing process.

# WAVE Content Specification 2018 - Video Profiles

<b>Media Profile Name</b>	<i>INFORMATIVE</i> <b>Codec</b>	<i>INFORMATIVE</i> <b>Profile</b>	<i>INFORMATIVE</i> <b>Level</b>	<i>INFORMATIVE</i> <b>Color primaries &amp; matrix coefficients</b>	<i>INFORMATIVE</i> <b>Transfer Characteristics</b>	<i>INFORMATIVE</i> <b>'codecs' MIME subparameters</b>	<b>NORMATIVE</b> <b>CMAF Brand</b>	<b>NORMATIVE</b> <b>Normative Reference</b>

The 2018 Edition of the WAVE Content Specification includes these video Media Profiles. Additional media profiles are likely to be added in an amendment prior to the 2019 edition of the WAVE Content Specification.

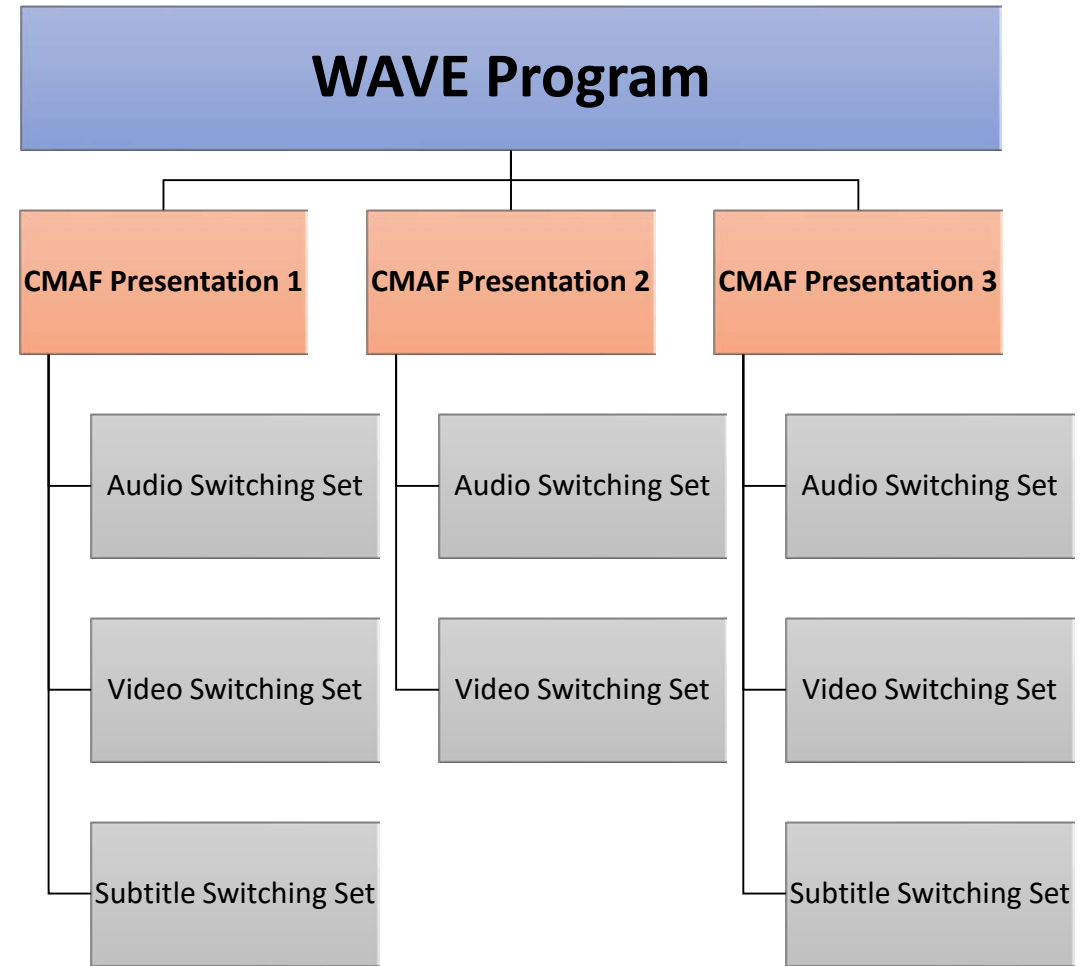

# WAVE Content Spec 2018 - Audio Profiles

- Some organizations outside MPEG are publishing bindings specifications for CMAF.
- ETSI is publishing CMAF bindings specs for Dolby and DTS audio codecs.
- Other organizations have suggested they will publish CMAF bindings in 2018.
- The WAVE Content Specification also includes both IMSC1 Text and Image CMAF bindings.

# WAVE Programs and Live Linear Content

- *WAVE Program*: Defined as a sequence of one or more CMAF Presentations.
  - Why? Because live linear content with ad insertions may require multiple CMAF Presentations (unlike VOD).
- A WAVE Program can (optionally) conform to a *WAVE Splice Constraint Profile*.
- The *Baseline Splice Constraint Profile* is:
  - Encoding constraints to enable continuous rendering of sequential Switching Sets in WAVE Programs
  - Intended for most existing adaptive streaming Players in the market today.
- WAVE will publish new, more advanced Splice Constraint Profiles as new devices enter the market.

*Continuous Rendering for a continuous user experience*

COMMUNITY & BUSINESS GROUPS

CURRENT GROUPS

REPORTS

[Home](#) / Web Media API Community Group

## WEB MEDIA API COMMUNITY GROUP

Media web application developers want to deploy their content on a wide and heterogeneous range of devices and platforms, e.g. televisions, set-top boxes, and mobile devices. To ensure a smooth user experience across devices, these user agents need to support a minimum set of Web technologies that developers can rely on being supported. This Community Group plans to specify such a set of Web technologies and additionally plans to provide guidance for developers and implementers e.g. on performance constraints and portability issues.

See the [CG charter](#) for more information.

*Note: Community Groups are proposed and run by the community. Although W3C hosts these conversations, the groups do not necessarily represent the views of the W3C Membership or staff.*

  - [w3.org/community/webmediaapi/](http://w3.org/community/webmediaapi/)
- 1. **Annual Web Media API spec**
  - define baseline web APIs to support media web apps.
- 2. **Guidelines for media web app developers**
- 3. **Identify gaps in current web APIs**
  - work with W3C Working Groups to update web standards.

# Web Media API Snapshot 2017

W3C Community Group  
Final Report

## Web Media API Snapshot 2017

Final Community Group Report 20 December 2017

### Latest editor's draft:

<https://w3c.github.io/webmediaapi/>

### Editors:

David Evans, [British Broadcasting Corporation](#)

Mark Vickers, [Comcast](#)

### Participate:

[GitHub w3c/webmediaapi](#)

[File a bug](#)

[Commit history](#)

[Copyright](#) © 2017 the Contributors to the Web Media API Snapshot 2017 Specification, published by the [Web Media API Community Group](#) under the [W3C Community Final Specification Agreement \(FSA\)](#). A human-readable [summary](#) is available.

### Abstract

This specification lists the Web APIs to support media web apps that are supported across all four of the most widely used user agent code bases at the time of publication. This specification should be updated at least annually to keep pace with the evolving Web platform. We encourage manufacturers to develop products that support the APIs in the most recent version of Web Media API Snapshot. This specification is comprised of references to existing specifications in W3C and other specification groups. The target devices will include any device that runs a modern HTML user agent, including televisions, game machines, set-top boxes, mobile devices and personal computers.

The goal of this Web Media API Community Group specification is to transition to the W3C Recommendation Track for standards development.

## • First annual API Snapshot published 20 December 2017:

<https://www.w3.org/2017/12/webmediaapi.html>

- Lists key APIs supported in 2017 in all major HTML code bases.
- CTA-W3C agreement to co-publish this spec.
- Plan to propose Community Group spec as a W3C standards track spec
- CTA WAVE released a test suite for all listed APIs based on W3C API tests (<https://webapitests2017.ctawave.org>).
- Test suite will enable manufacturers to test that their HTML support is up-to-date!

# The WAVE Web Media API Snapshot 2017

Download WAVE specifications in PDF format at:

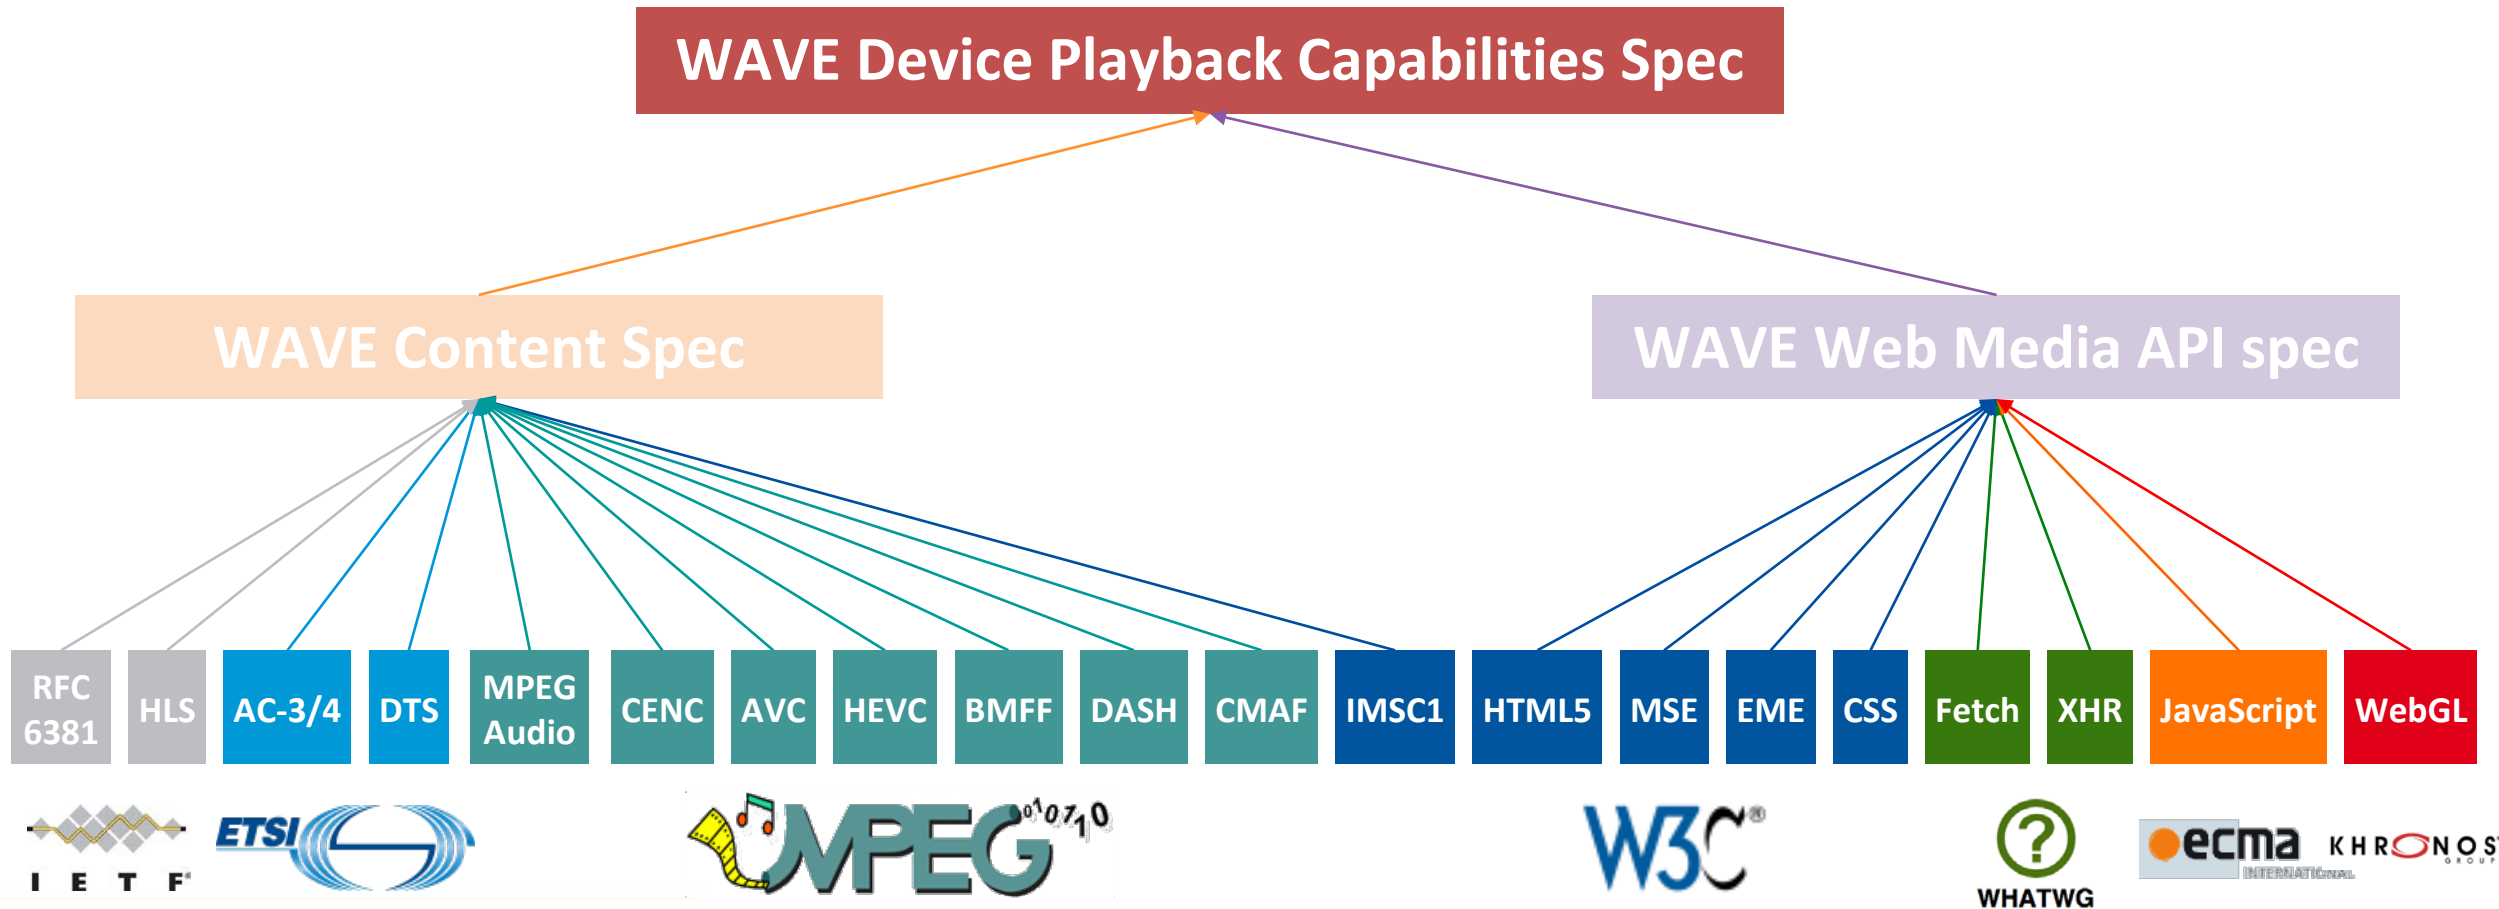

<https://cta.tech/WAVE>

*This is a **free** download.*

# Device Playback Capabilities Specification

# OTT Device Performance Challenges

## • Ad splicing problems

- Regional profiles (50/60Hz)
- Request protocol deficiencies

## • Unknown codec capabilities

- Unknown rendering capabilities
- Partial profile support
- Codec incompatibility

## • Long-term playback instability

- Late Binding Synchronization

## • Audio discontinuities

- Glitches when switching bitrate
- Memory problems
- Limited processing power
- Long start-up delay
- Performance monitoring
- DRM support

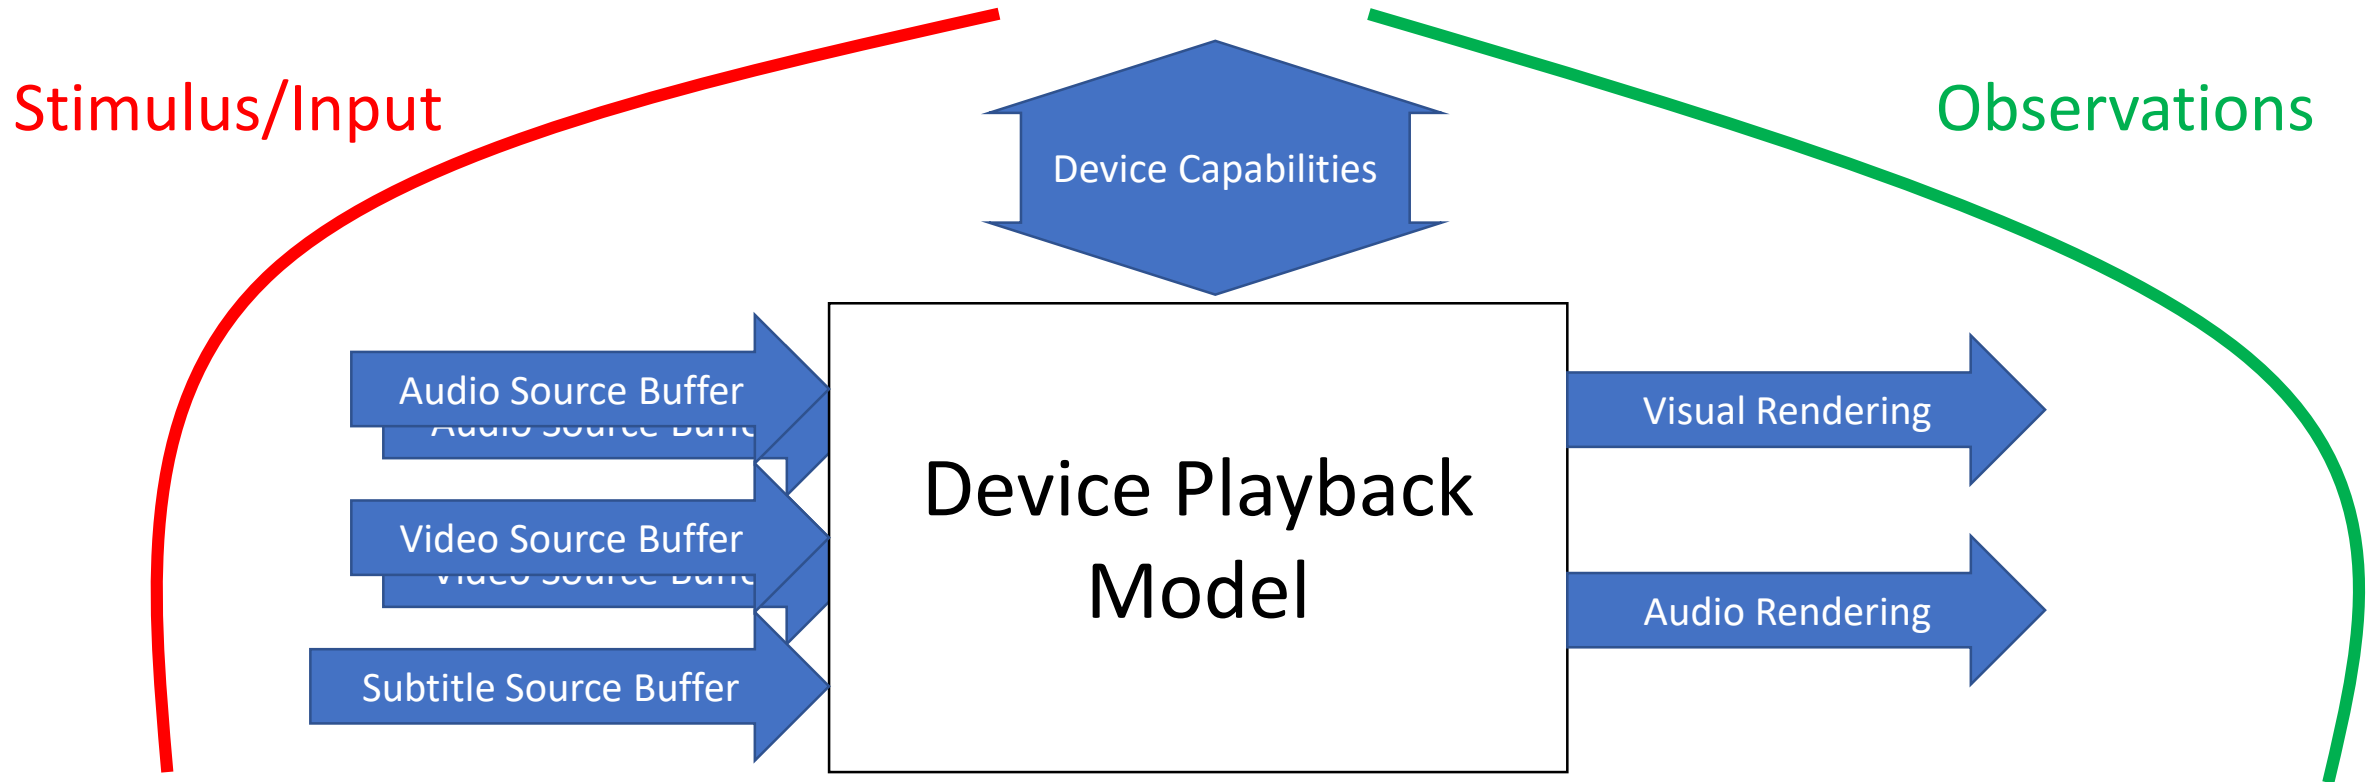

## • Variable HDR support

- Scaling display issues

# Device Playback Focus

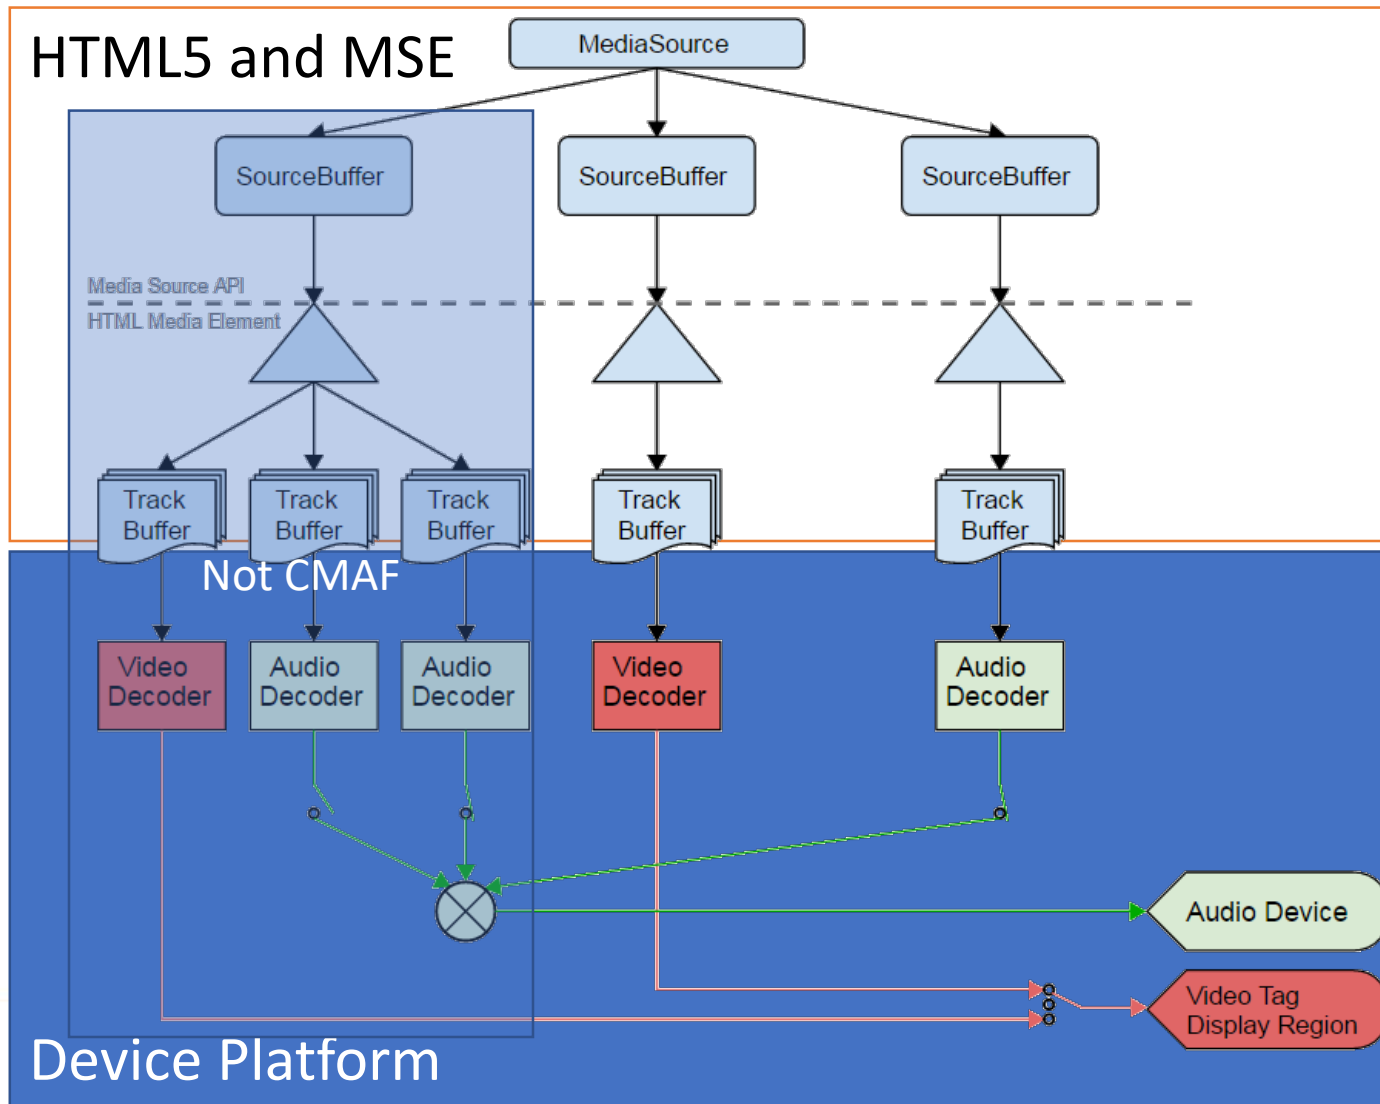

- Device definition:
  - Codecs & Rendering, possibly on different devices (HDMI, Miracast, etc.)
- Capabilities discovery
- Playback of *a Presentation (of Media Profiles)*
  - Player Requirements such as splicing segments, switching, random access
- Playback of *a sequence of Presentations*
  - Splicing—for example for ad insertion or program boundaries
- Other playback capabilities, e.g. support for multiple decoders

# Abstracted Device Playback Model

Requirements: If you **input** WAVE content, this shall be the **observation**

# Connection to HTML5 & MSE

## HTML5 and MSE

- Provide APIs for applications to playback WAVE content
- Extend APIs to ensure more consistent and richer user experience

## Device Playback Platform:

- Ensuring that WAVE content can be “played” consistently when using “MSE-like” APIs for different use cases and applications.
- Use HTML5 as reference and test platform, not excluding other platforms

# Device Playback

One of the key missing pieces for consistent Internet TV Services

## Media Source Extension

- Extends HTMLMediaElement
- Enables JavaScript to generate media streams for playback.
- Allowing JavaScript to generate streams facilitates a variety of use cases like adaptive streaming and time shifting live streams.

## ByteStream Format for ISO BMFF

- <https://www.w3.org/TR/mse-byte-stream-format-isobmff/>
- This specification defines a [Media Source Extensions™](#) [[MEDIA-SOURCE](#)] byte stream format specification based on the ISO Base Media File Format.

```
var ms = new MediaSource();
video.src = window.URL.createObjectURL(ms);
ms.addEventListener('sourceopen', onMediaSourceOpen);

function onMediaSourceOpen() {
    sourceBuffer = ms.addSourceBuffer('video/mp4; codecs="avc1.4d401f"');
    sourceBuffer.addEventListener('updateend', nextSegment);

    GET(initUrl, appendToBuffer);

    video.play();
}

function nextSegment() {
    var url = templateUrl.replace('$Number$', index);
    GET(url, appendToBuffer);
    index++;
    if (index > numberOfChunks) {
        sourceBuffer.removeEventListener('updateend', nextSegment);
    }
}

function appendToBuffer(videoChunk) {
    if (videoChunk) {
        sourceBuffer.appendBuffer(new Uint8Array(videoChunk));
    }
}
```

# Capabilities Discovery by the Player App

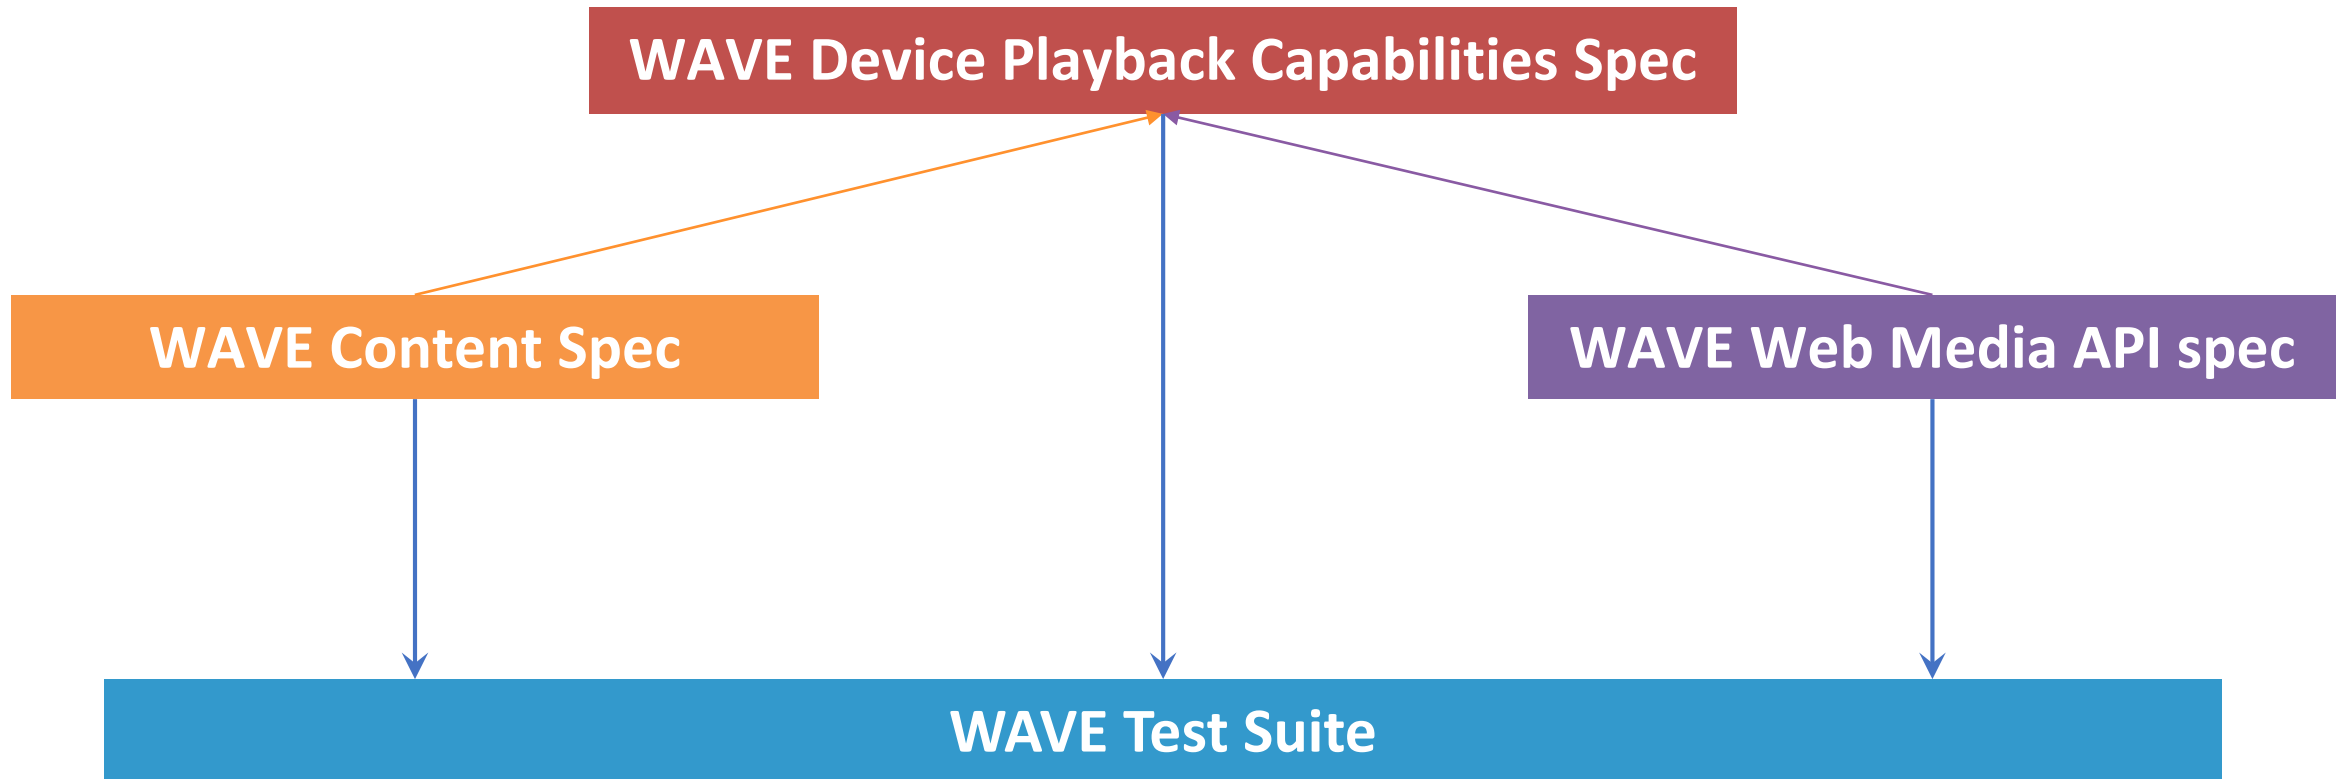

- Apps need to know device capabilities—but it is not (yet) fully available
- Some possibilities under discussion:
  - `isSupportedType()` or `canPlayType()` APIs
    - Use MIME type to check device support of Media Profile
  - Device Platform can provide an API to check Media Profiles
    - Media Profile is provided in the manifest or in the CMAF Header (ftyp box).
  - MIME Subparameters
    - App uses a detailed MIME type string when checking capabilities
  - Media Capabilities API
    - Published by the W3C Web Platform Incubator Community Group
    - See <https://wicg.github.io/media-capabilities/>
- This topic is still under discussion

# Device Playback – Next Steps

- Specification release – Q4 2018
- Test suite development begins – Q4 2018
  - Relies on specification
  - RFP process in Q4, award and development starting in Q1 2019
- Annual updates

# WAVE Test Suite

# Questions addressed with the WAVE Test Suite

- Given a content stream,
  1. *Does it comply to WAVE Content Spec requirements?*
  
- Given a device platform with a User Agent,
  2. *Does the underlying platform meet Device Playback Capabilities Spec requirements?*
  3. *Does the API comply to WAVE HTML5 API requirements?*

# WAVE Approach to Test

- Compliance program (not certification or “logo” program)
- Partner with other groups where possible (e.g. DASH-IF, W3C)
  - Extend existing test efforts
  - Some new WAVE use cases lead to new tests
- WAVE arranges for the creation of new test material as needed
  - Cooperate with partner groups
  - Avoid hard ‘forks’ of existing open source tests
  - Continue licensing agreements on existing projects
  - Currently using “free, open source” model

# WAVE HTML5 API Test Suite

Content

Content Validator

Device Playback  
Capabilities

Device Playback  
Test Suite

HTML5 Reference  
Platform

WMAS2017  
Test Suite

- Based on W3C Web Platform Tests under agreement with W3C
- Verifies API under certain assumptions
- Published and available now

# WMAS2017 Test Suite – Assumptions

- Based on Web Media API Snapshot 2017 (WMAS2017) specification
- Modified to run on general-purpose *and* embedded systems
  - E.g., laptops/tablets/phones *and* smart TVs/media sticks/STBs
- Targets APIs that pass on the four main browser codebases (Chromium, Edge, Gecko, WebKit; using [CanIUse.com](http://CanIUse.com))
- Verified on:
  - Downloadable browsers (cf. codebases)
  - Three embedded systems (smart TV, media stick, gaming console)

<https://webapitests2017.ctawave.org>

- XHR

Select APIs to test

Select all Deselect all 20 tests selected

- Filter test cases for successfully passed tests on the following web browser
- None
  - Edge 16
  - Firefox 57
  - Safari 10.13.1
  - Chromium 63
  - All browsers

Select only the APIs that pass specific browsers

Continue

And run the tests

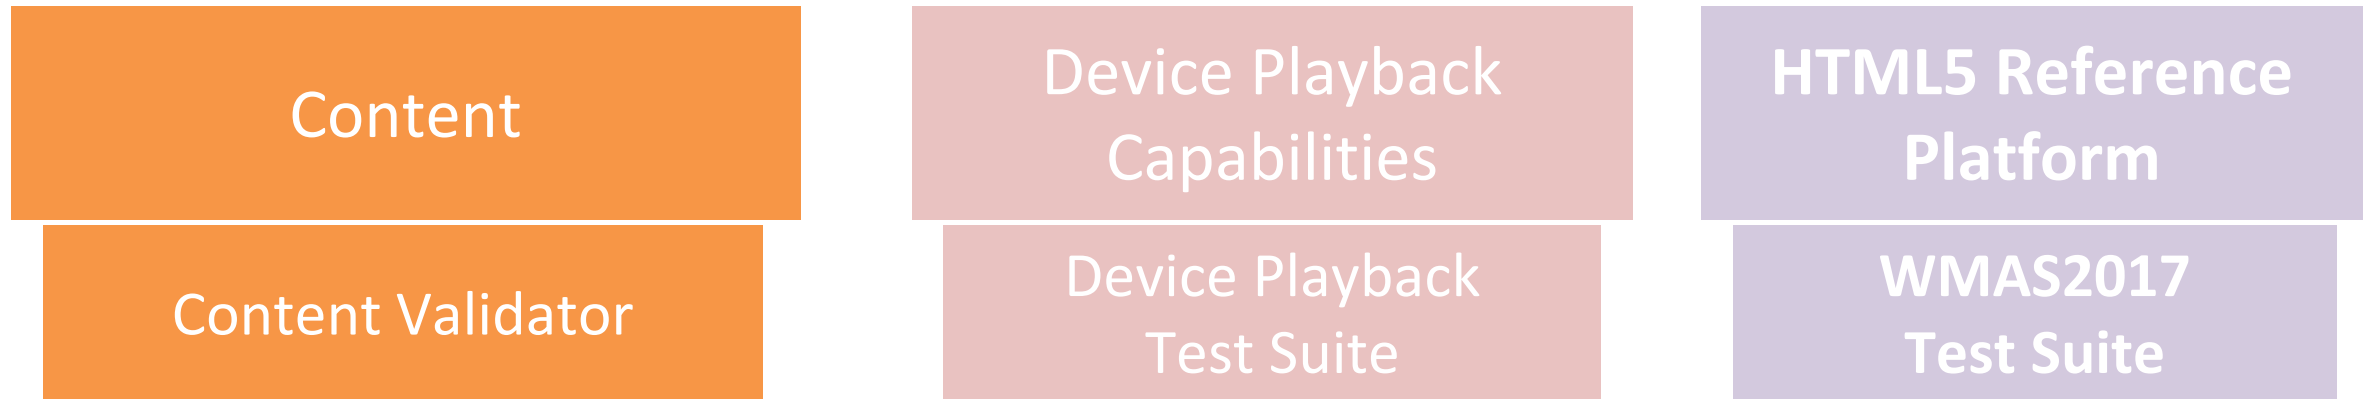

### Notes

In case the test run seems to have stopped or the browser has crashed, it is possible to resume the test run session with the next test after the one that caused the problem by simply going back to <http://webapitests2017.ctawave.org:8050>. The test runner will recognize the ongoing test session.

# WAVE Test Material – HTML5 API Reference Platform

- Web Media API Snapshot 2017 Test Suite
  - Test drive live (unblock port 8050)
    - <https://webapitests2017.ctawave.org/>
  - Open Source version (for porting to e.g. smart TVs)
    - <https://github.com/cta-wave/WMAS2017>
  - Issues list (*public—if you encounter a bug or need a feature*)
    - <https://github.com/cta-wave/WMAS2017/issues>

# WAVE Content Validator

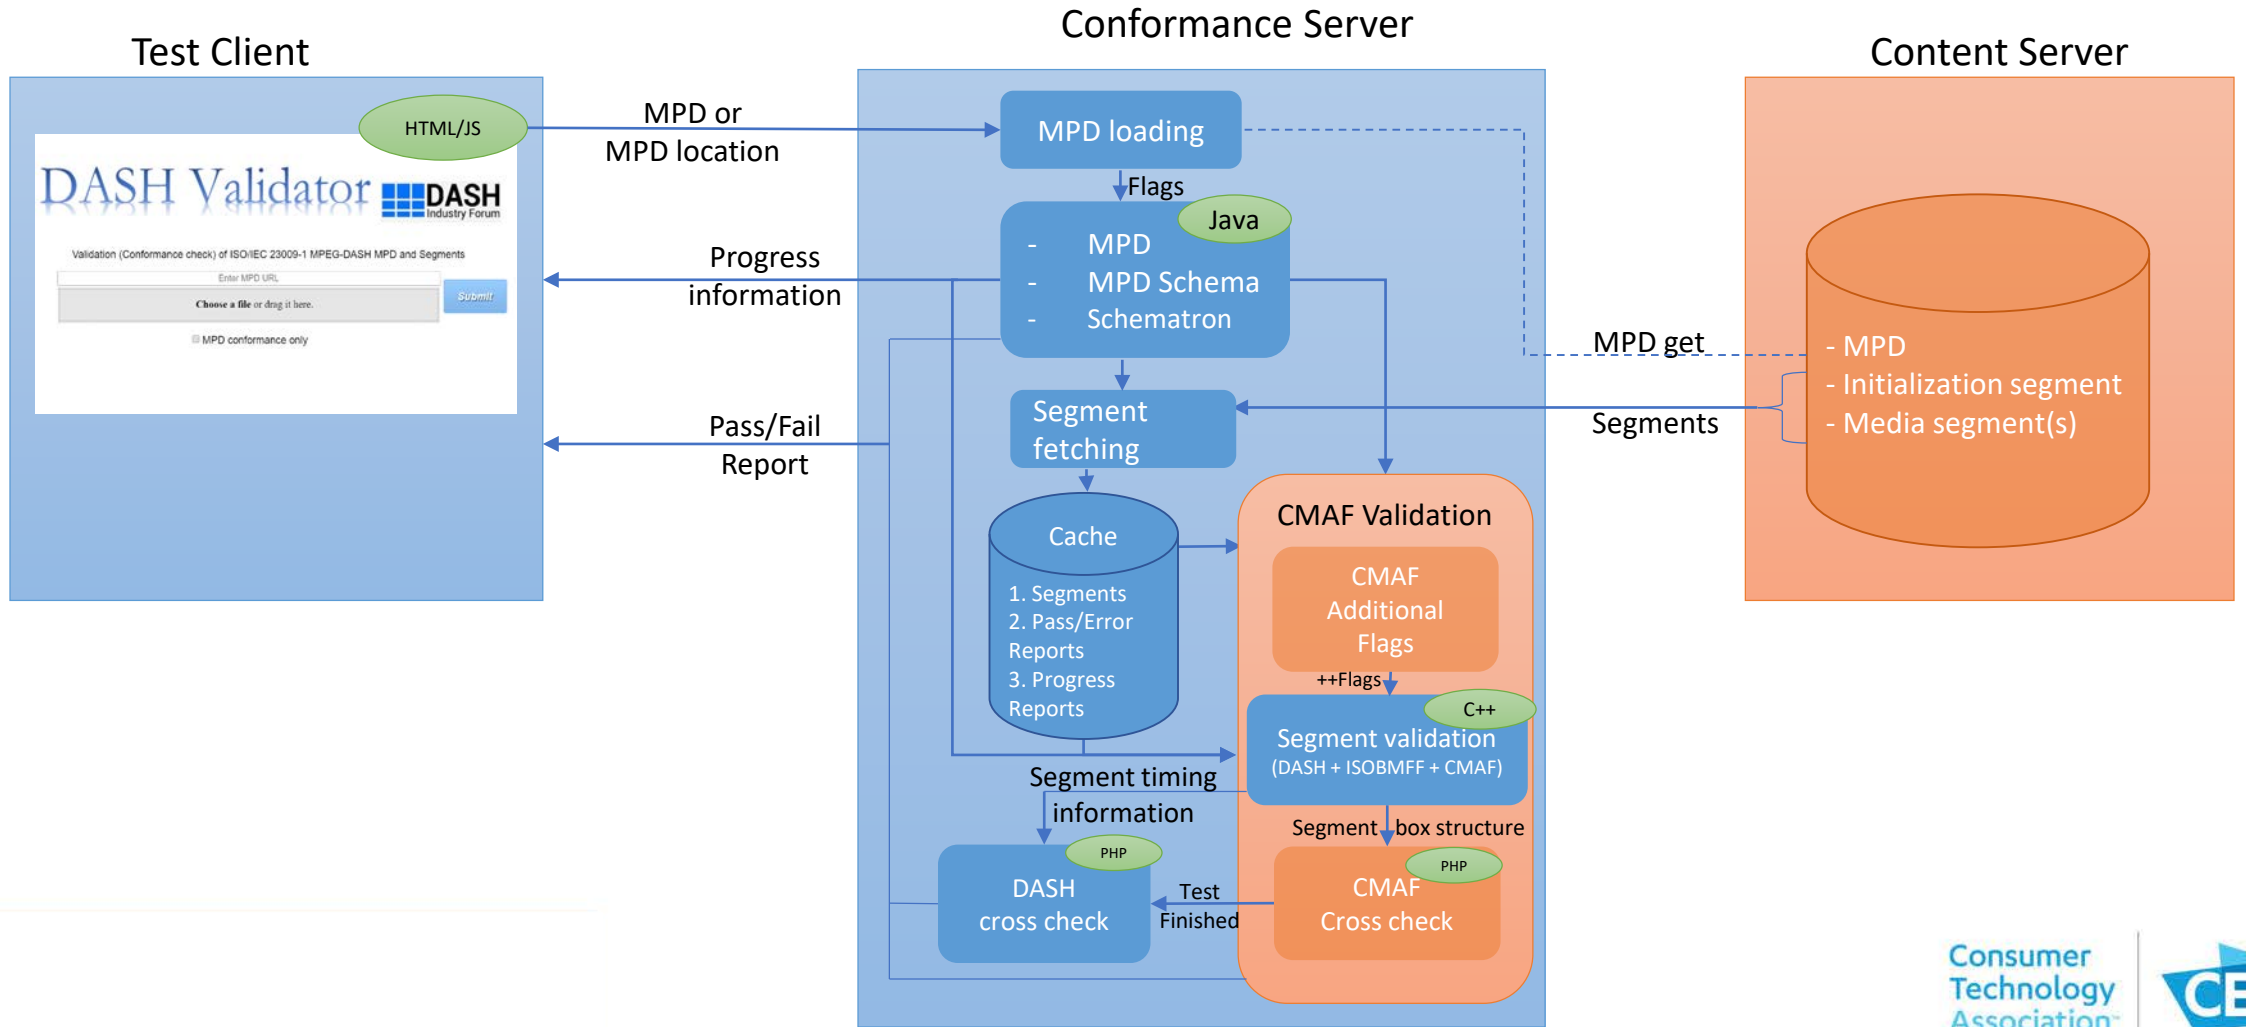

- Based on DASH-IF Content Validator under agreement with DASH-IF
- Verifies CMAF packaging of content
- Does not inspect elementary streams *inside* the CMAF packaged content
- Project under way; should publish Q1 2018

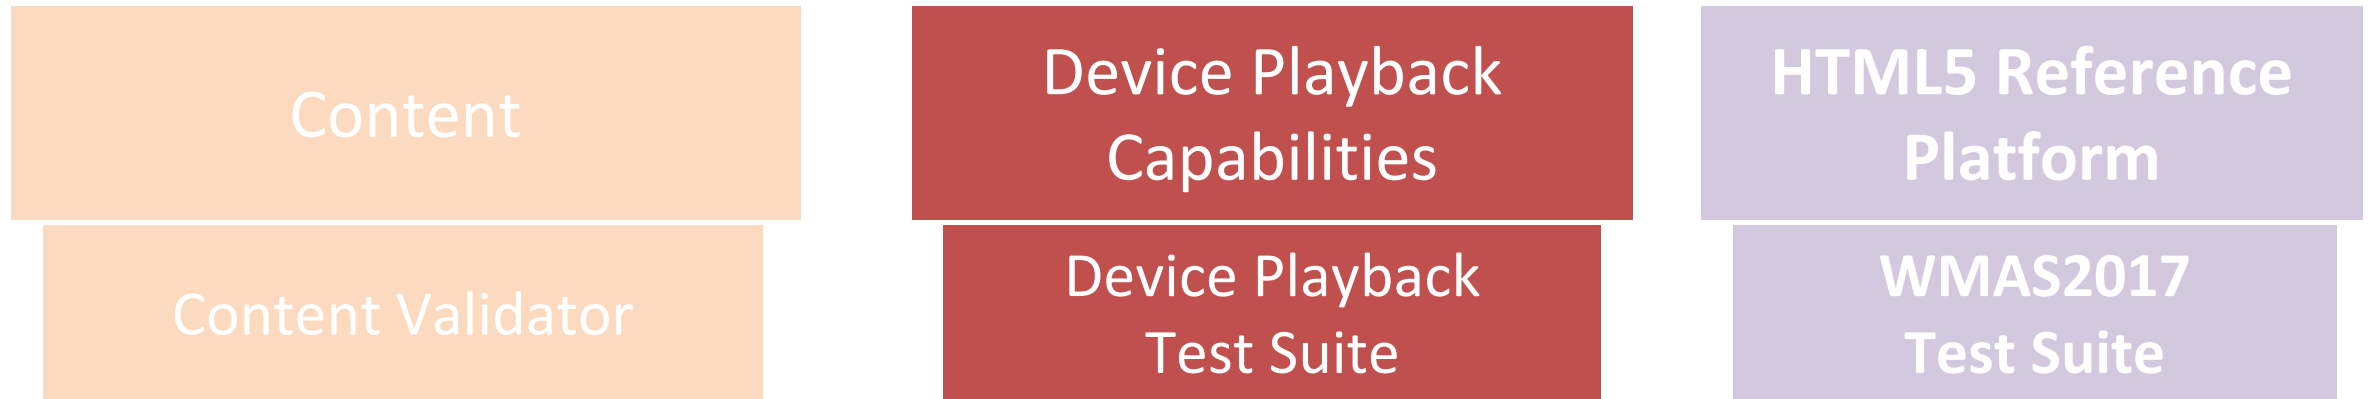

# WAVE Content Conformance

- WAVE Content is CMAF Content
- Starting with MPEG-DASH conformance tool
  - “MPEG-DASH format” is *almost* “CMAF format”
- Validation against:
  - ISO-BMFF rules
  - General CMAF rules about segment boxes/CMAF Tracks and Addressable Resources
  - MPD information specific rules for segment boxes (MPD is assumed as manifest for CMAF Presentation)

# Architecture- Conformance Software

# WAVE Device Playback Capabilities Test

- Not based (yet) on existing test suites
- Downstream of specification release

# Wrap-Up

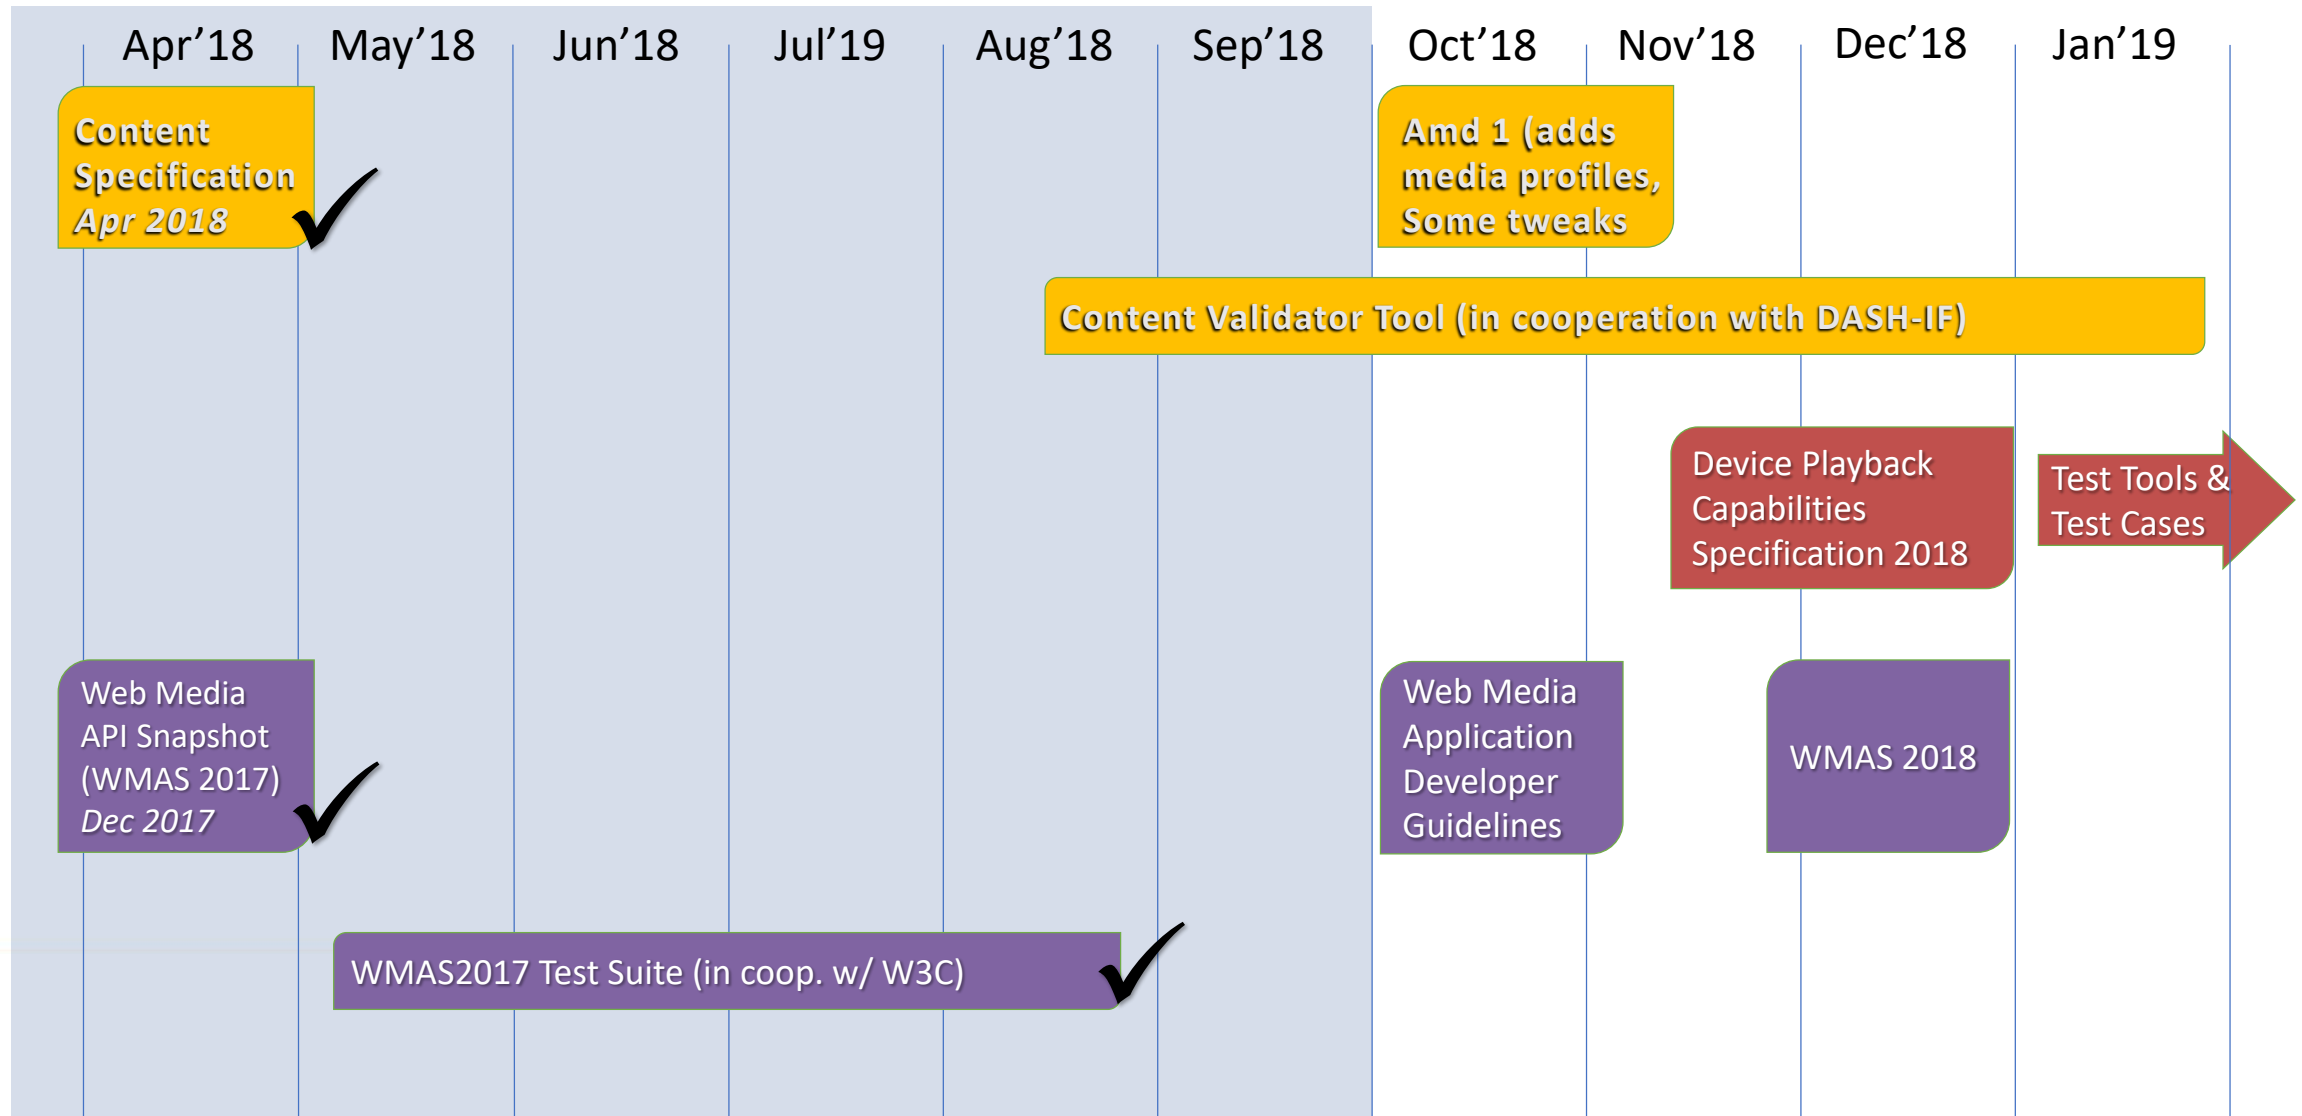

WAVE Device Playback Capabilities Spec

WAVE Content Spec

WAVE Web Media API spec

# WAVE Roadmap 2018

# Key Take-Aways

- WAVE promotes interop for commercial OTT streaming
  - on laptops, phones, and tablets;
  - and on embedded systems like smart TVs, media sticks, gaming consoles, and STBs.
- Key specs are **MPEG-CMAF** and **MPEG CENC** (content preparation) over **HLS** and **MPEG-DASH** to a (preferred) environment based on **HTML5 APIs** incl. **MSE/EME**.
- The WAVE Content and HTML5 API specifications available now
- The HTML5 API test suite is available now; the Content Validator is due Q1 2019
- The DPCTF specification and test suite are coming soon
- WAVE is global in scope and welcomes increased global participation.

# How to Get Involved

- WAVE Specifications – free PDF download at [CTA.tech/WAVE](https://cta.tech/WAVE)
- This slide deck: [CTA.tech/WAVE](https://cta.tech/WAVE) under Resources *(by Thursday 10/4/2018)*
